About This Guide

This guide is a reference to FatWire Content Server's property files and the properties they contain. The properties are used to specify the operating parameters for Content Server and its applications.

Who Should Use This Guide

This guide is written for Content Server installation engineers, developers, and administrators of Content Server systems.

How This Guide Is Organized

This guide organizes property files by Content Server product.

The introductory section explains the importance of using the Property Editor to modify property files, and provides instructions on using the Property Editor.

Part 1, "Content Server Property Files" covers properties for Content Server and its page caching application Satellite Server.

Part 2, "Content Server Applications" covers the property files of the Engage add-on application and remotely installed Satellite Server.

Part 3, "Third-Party Libraries and Applications" explains how Content Server integrates with third-party libraries.

At the end of this reference are several indexes to help readers find topics and properties in this guide and to quickly identify new and deprecated properties.

Related Documents

See the following documents in the FatWire documentation set:

- FatWire Content Server Administrator's Guide
- FatWire Content Server Developer's Guide
- FatWire Content Server Tag Reference
- FatWire Content Server Dash Interface User's Guide

Conventions

The following text conventions are used in this guide:

- **Boldface** type indicates graphical user interface elements that you select.
- *Italic* type indicates book titles, emphasis, or variables for which you supply particular values.
- Monospace type indicates file names, URLs, sample code, or text that appears on the screen.
- Monospace bold type indicates a command.

Third-Party Libraries

FatWire Content Server 7.6 patch 2 and its applications include third-party libraries. For additional information, see *FatWire Content Server 7.6 Patch 2: Third-Party Licenses*.

Introduction

Many of your configuration tasks for FatWire Content Server and its applications require you to set or modify values for properties that are specified in property files. These files have either the .ini or .properties suffix.

A set of property files, along with the "Property Editor" utility, is provided with Content Server. At least one property file is associated with each of the Content Server applications.

This introduction describes the Property Editor and summarizes the property files that are presented in the rest of this reference.

This introduction contains the following sections:

- Using the Property Editor
- Starting the Property Editor
- Setting Properties
- Adding Properties
- Deleting Properties

Using the Property Editor

The Property Editor is used to set the values of properties in Content Server's property files. FatWire recommends that you always use the Property Editor to set values, because using other editors can create problems. For example, the JumpStart Kit renames property files; launching the Property Editor ensures that the correct file will be displayed for modification. The Property Editor is also capable of encrypting password fields; modifying the fields outside the Property Editor can corrupt the property values. In addition, the Property Editor ensures that the files are correctly formatted; specifically, the correct property separator characters are used. Furthermore, the Property Editor organizes properties by function on tabs, and provides descriptive information about the properties, as well as default or possible values.

Starting the Property Editor

Execute the following scripts at the command line prompt or in a UNIX shell:

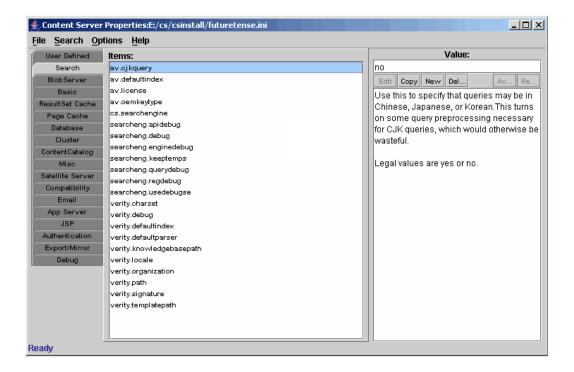

- Windows: propeditor.bat, typically located in <cs_install_dir>/
- Solaris: propeditor.sh, typically located in \$HOME/<cs_install_dir>

Setting Properties

To set properties for Content Server and its applications:

- 1. Start the Property Editor, as previously described in "Starting the Property Editor."
- 2. Select File > Open.
- **3.** Browse to the property file that you need to modify and then select it.

The Property Editor opens the file. For example, this is what the futuretense.ini file looks like when it is first opened in the Property Editor:

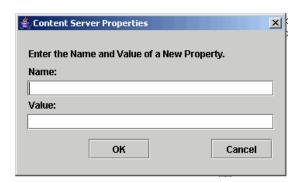

- The tabs (on the left-hand side) group properties by function.
- The **Items** pane lists the properties in the selected tab.
- The **Value** pane lists the current value for the selected property, a brief description of the property, and acceptable values for the property.
- **4.** Select the tab that represents the functional group that contains the property that you want to configure.
 - The Property Editor displays the properties from that tab in the **Items** pane.
- **5.** Select the property from the **Items** pane.
 - The Property Editor displays the value that is currently set for that property value and a provides a brief description of the property in the **Values** pane.
- **6.** In the **Values** pane, enter the value for the property in the text field at the top.
- 7. Click Accept.
- **8.** Repeat steps 4 through 7 for each property that you want to configure.
- **9.** When you are finished, select **File > Save**.
- **10.** Select **File > Close**.
- 11. Stop and restart the application server so the new values can take effect.

Adding Properties

Some configuration tasks require you to add new, custom properties for your system. For example, when you implement resultset caching, you can create up to three properties for any Content Server database table for which you want to set caching values. (For information about resultset caching, see the *Content Server Developer's Guide*.)

To add a property to the Content Server database

- **1.** Start the Property Editor, previously described in "Starting the Property Editor" on page 10.
- 2. Select **File > Open**.
- **3.** Browse to the property file in which you need to add a property.
- **4.** (Optional) Select the **User Defined** tab. (This step is optional because any property that you create is displayed on the **User Defined** tab the next time you open this property file in the Property Editor no matter which tab you select.)
- 5. In the Values pane, just under the text entry field, click New.
 The Property Editor displays the Content Server Properties dialog box:

- **6.** Click in the **Name** field and enter the name of the new property.
- **7.** Click in the **Value** field and enter the value for the new property.
- 8. Click OK.

The new property appears in the **Items** pane and the value appears in the **Values** pane.

Note

If you did not select the **User Defined** tab in step 4, the new property might appear on the tab that was selected when you clicked **New** in step 5. This is temporary. The next time that you open this ini file in the Property Editor, the property is displayed on the **User Defined** tab.

9. Select File > Save.

Deleting Properties

It is unlikely that you will ever have to delete a property. However, if you do have to delete a property, refer to the steps below.

To delete a property

Caution

Never delete a required property.

- 1. Start the Property Editor. (See "Starting the Property Editor," above.)
- 2. Select **File > Open**.
- **3.** Browse to the property file that you need to modify by deleting a property and select it.
- **4.** Select the tab that represents the functional group that holds the property that you want to delete.
- **5.** Take note of the current value for this property just in case you need to restore it for any reason.
- **6.** In the **Values** pane, just under the text entry field, click **Delete**. The Property Editor displays a confirmation message.
- 7. Click Yes.
- **8.** The property is deleted from the property file.
- 9. Select File > Save.

Part 1

Content Server Property Files

This part lists the property files that are installed and used by Content Server, including its user manager plug-ins and co-resident Satellite Server. The Property Editor is used to set properties in Content Server's property files.

This part contains information about the following property files:

- assetframework.ini
- batch.ini
- catalog.ini
- commons-logging.properties
- CSPortletRequest.properties
- dir.ini
- futuretense.ini
- futuretense xcel.ini
- gator.ini
- jsprefresh.ini (Deprecated)
- logging.ini (Deprecated)
- log4j.properties
- omii.ini
- omproduct.ini
- satellite.properties
- ServletRequest.properties
- ui.properties
- uiadmin.properties
- visitor.ini
- WL6.ini
- xmles.ini

assetframework.ini

The assetframework.ini file holds properties that determine the storage locations of files that hold information about flex asset history and publishing.

This file has a single tab, named "User Defined," in the Property Editor.

assetframework.ini: User Defined Tab

Properties assetframework.ini: User Defined Tab

Property	Description
afk.historydata	Specifies the directory that holds history data. Default value: c:/futuretense/history/
afk.publishdata	Specifies the directory that holds publish data. Default value: c:/futuretense/publish/

batch.ini

The batch.ini file provides configuration information for batch processes, which are used in the background by Content Server for various reasons (publishing, for example).

Properties in batch.ini are organized by function on the following tabs in the Property Editor:

- Configuration Tab
- Debug Tab
- Results Tab
- Security Tab
- User Defined Tab

batch.ini: Configuration Tab

The **Configuration** tab holds properties that are used to configure settings for the threads that are used by the batch processes.

Properties in batch.ini: Configuration Tab

Property	Description
thread.count	Specifies the number of dispatcher threads to allocate and manage in the pool.
	Default value: 32
thread.growcache	Specifies whether additional dispatcher threads (in excess of the number specified by thread.count) can be allocated to the pool if they are needed.
	Possible values: true false
	Default value: false
thread.idle	Applies only when thread.growcache is set to true.
	Specifies the number of seconds a dispatcher thread can remain idle before it is released by the pool.
	Default value: 10
thread.wait	Applies only when thread.growcache is set to false.
	Specifies the number of seconds that a batch process waits for a free dispatcher thread before it reports an error because it cannot complete its task.
	Default value: 15

batch.ini: Debug Tab

Properties in batch.ini: Debug Tab

Property	Description
debug	Specifies whether debugging for batch processes is enabled or disabled. If you set this value to true, messages about the status of batch processes are written to the futuretense.txt file. Default value: false

batch.ini: Results Tab

Properties in batch.ini: Results Tab

Property	Description
request.folder	Specifies the location of the file that stores information about the results of batch processes. For example, the CS publishing system uses this directory to hold the publishing log files.
	Default value: /dispatcher/

batch.ini: Security Tab

Properties in batch.ini: Security Tab

Property	Description
security.class	Specifies the name of the class file that is used for security checks. The default is provided for reference only:
	com.openmarket.Batch.DefaultSecurity
	Do not change the value of this property.

batch.ini: User Defined Tab

Properties in batch.ini: User Defined Tab

Property		Description
	Note: This tab	, by default, holds no properties.

catalog.ini

The catalog.ini file holds properties that Content Server uses to configure the shopping cart.

Properties in catalog.ini are organized by function on the following tabs in the Property Editor:

- Catalog Tab
- User Defined Tab

catalog.ini: Catalog Tab

Properties in catalog.ini: Catalog Tab

Property	Description
mwb.cartsetdir	Specifies the directory path (including the terminating slash character) where cartset data files are stored.
	This value is set by the installation. It points to the /gator/cartset directory in the installation directory.
	Do not change the value of this property.

catalog.ini: User Defined Tab

Properties in batch.ini: User Defined Tab

Property	Description
Note: This tal	o, by default, holds no properties.

commons-logging.properties

Content Server employs Jakarta Commons Logging to write messages to its log files. By default, the following loggers are provided with Content Server: TraditionalLog, StandardLog, TraditionalStandardLog, and Log4JLogger. A large variety of other loggers are available in the public domain. You can also write your own if the features sought are not present in any available loggers.

The Content Server logger is set during the installation process. You can manually switch the logger by setting the org.apache.commons.logging.Log property in commons-logging.properties to one of the class names listed below:

TraditionalLog

com.fatwire.cs.core.logging.TraditionalLog

This logger writes all log messages to the futuretense.txt file for each server. TraditionalLog supports log file rolling, custom formatting, date-stamping, and a variety of other features. Optionally, TraditionalLog supports browser-based log retrieval by filtering log messages based on the client's IP address.

StandardLog

com.fatwire.cs.core.logging.StandardLog

This logger also supports custom formatting, date-stamping, and so on, but it sends messages to the standard output and standard error streams; in other words, it sends messages to the java console instead of futuretense.txt. While StandardLog does not support browser-based log retrieval, it offers another useful feature: It allows developers running a Jump Start Kit or running Content Server in an IDE debugger to see all of the log messages in the most obvious place. Using StandardLog is good practice for all template developers, because it alerts you to errors by default, as opposed to sending an error to the futuretense.txt file, where it requires some effort to be viewed. StandardLog is similar to Apache's default SimpleLog.

StandardTraditionalLog

com.fatwire.cs.core.logging.StandardTraditionalLog

This logger supports the features and output methods of TraditionalLog and StandardLog.

Log4JLogger

com.fatwire.cs.core.logging.Log4JLogger

This logger supports all the features and output methods of TraditionalLog and StandardLog. It also enables the **Configure log4j** and **Log Viewer** system tools, which provide the ability to configure log4j loggers and view, tail, download, and search the log directly from the Content Server Advanced interface. Log4JLogger is set in the commons-logging.properties file, but must be configured in the log4j.properties file (see page 146). For complete instructions on setting up log4j for Content Server, see the *Content Server Administrator's Guide*.

The commons-logging properties file lists the logging properties that can be modified for Content Server. The properties are organized by function on the following tabs in the Property Editor:

- User Defined Tab
- Loggers Tab
- Traditional Log Tab
- Factory Tab

commons-logging.properties: Factory Tab

Properties in commons-logging.properties: Factory Tab

Property	Description
org.apache.commons.logging. Log	Specifies the class name implementing the org.apache.commons.logging.Log interface that the default commons-logging log factory will use as the logger.
	Default value: com.fatwire.cs.core. loggingTraditionalLog
	The default value names a Content Server enhanced logger that supports additional features not necessarily supported by other loggers, including browser-based retrieval of the log file, rolling logs, and timestamps.
	Note: Before modifying the value, consult the commons-logging documentation.
org.apache.commons.logging. LogFactory	Enables a special publishing logger that prints the pubsessionid in each log message when a publishing event is in progress. Use this logger to analyze publishing failures.
	This property must be manually added to commons-logging.properties.
	Legal value: com.fatwire.cs.core. logging.ContextAwareLogFactory
	Note: Enabling this logger automatically disables per-client logging (the value of the logging.per-client-log property is ignored).

commons-logging.properties: AsyncLog Tab

Properties in commons-logging.properties: AsyncLog Tab

Property	Description
logging.interval	Specifies the time interval (in milliseconds) between writes to the log file.
	Default value: 5000

commons-logging.properties: Loggers Tab

Properties in commons-logging.properties: Loggers Tab

•	
Property	Description
com.fatwire.logging.cs	Specifies the log severity for the generic Content Server logger. Messages written to this logger relate to the core Content Server functionality, or they have not been assigned a more appropriate logger.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. auth	Specifies the log severity for user authentication and user authorization messages. Messages written to this logger relate to user login, user ACLs and user roles.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. blobserver	Specifies the log severity for BlobServer debug messages. Messages written to this logger relate to the addition, retrieval, and modification of data in CS page caches.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. cache.page	Specifies the log severity for page cache debug messages. Messages written to this logger relate to the addition, retrieval, and modification of data in CS page caches.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. cache.resultset	Specifies the log severity for result set cache debug messages. Messages written to this logger relate to the addition, retrieval, and modification of data in CS result set caches.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO

Properties in commons-logging.properties: Loggers Tab (continued)

Property	Description
com.fatwire.logging.cs. core.http.HttpAccess	Logger used by the HttpAccess API to record errors and warnings encountered during HTTP access. This log produces HTTP Request and Response information, including headers, parameters, and body content. DEBUG generally produces large amounts of log messages.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. core.uri.assembler	Logger used by the URI assembler engine and all assemblers.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. core.uri.definition	Logger used by URI definitions and related implementations.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs.db	Specifies the log severity for database access messages. Messages written to this logger relate to database access, queries and statement execution. It can be very helpful to use this logger to debug database queries that are not behaving as expected.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. errno	Logger used to display information related to setting an error number. Messages written by this logger relate to the values set for the Variables.errno and Variables.errdetail Content Server variables. For more information about setting error numbers, see the Content Server Developer's Guide and the Content Server Tag Reference.
	Possible Values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default Value: INFO

Properties in commons-logging.properties: Loggers Tab (continued)

Property	Description
com.fatwire.logging.cs. event	Specifies the log severity for CS event engine messages. Messages written to this logger relate to the invocation of events by CS.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. export	Specifies the log severity for CS page export engine messages. Messages written to this logger relate to the invocation of events by CS.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. filelock	Specifies the log severity for file locking messages.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs.	Logger for FirstSite II filters.
TITSUSTUE.TITUET	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. install	Specifies the log severity for the CS installer's messages. Messages are only written to this log during installation.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs.jsp	Specifies the log severity for CS jsp element debug information. Messages written to this logger relate to the invocation of JSP elements by CS.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO

Property	Description
com.fatwire.logging.cs. request	Specifies the log severity for request processing messages.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. satellite	Generic logger for Satellite Server. Messages logged with this logger pertain to system configuration.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. satellite.cache	This logger for Satellite Server deals with information relating to the parsing of objects that can be cached, as well as their lifecycle in the cache.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
<pre>com.fatwire.logging.cs. satellite.host</pre>	This logger for Satellite Server is dedicated to logging information that relates to communication between Satellite Server and its host Content Server.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. satellite.request	This logger for Satellite Server is dedicated to logging information that relates to processing requests from the client.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO

Property	Description
com.fatwire.logging.cs. session	Specifies the log severity for the Content Server session logger. Messages written to this logger relate to session creation, modification, and access.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs.	Specifies the log severity for CS cluster synchronization messages. Messages written to this logger relate to cluster sync behavior of CS.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs. sysinfo	Specifies the log severity for capturing system information on the Content Server installation. As of CS 7.6, this logger is used by the System Tools utility, introduced in CS 7.6 and made available on the Admin tab, in the Content Server Advanced interface. For more information about System Tools, see the <i>Content Server Administrator's Guide</i> . Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
<pre>com.fatwire.logging.cs. time</pre>	Specifies the log severity for CS time and performance debug information. Messages written to this logger include information that can be used to tune the performance of pages and of CS in general.
	To log the execution time for pages and pagelets, set this property to DEBUG. When the pages and pagelets are executed, a message similar to the following will be returned:
	"Execute page OpenMarket/ Xcelerate/Util/getCurrentUser Hours: 0 Minutes: 0 Seconds: 0:002"
	Note: Pages are executed only if they are not found in cache.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO

Property	Description
com.fatwire.logging.cs. visitor.object	Logger for tracking the visitor object lifecycle. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. visitor.ruleset	Logger for rule set compilation. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. xcelerate	Logger for Xcelerate. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. xcelerate.advantage.re commendation	Logger for recommendation processing. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. xcelerate.approval	Logger for asset approval processing. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. xcelerate.asset	Logger for generic asset processing. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
com.fatwire.logging.cs. xcelerate.assetmaker	Logger for assetmaker processing. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO

Property	Description
com.fatwire.logging.cs.	This logger captures publishing logs.
xcelerate.publish	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
	Note: DEBUG and TRACE settings produce a large quantity of logs and can severely impact performance.
com.fatwire.logging.cs. xcelerate.template	Logger for Template, CSElement, and SiteEntry asset processing.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.cs.xml	Specifies the log severity for CS XML element debug information. Messages written to this logger relate to the parsing and evaluation of XML elements. It should be noted that enabling this debug flag will cause CS to use a validating XML parser instead of the default non-validating parser. This can have effects on rendered pages. Consult the documentation for details.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.search.asset	Logger used by asset-related search.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
org.apache.commons.http client.HttpClient	Top-level logger used by the HttpClient library. For more information, go to: http://jakarta.apache.org/commons/httpclient/logging.html
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO

Properties in commons-logging.properties: Loggers Tab (continued)

Property	Description
org.apache.commons.http client.HttpMethodBase	One of the key loggers for the HttpClient library. This logger is set to log a warning every time a response is read as a String. The warning is well-intended; however, in Content Server, the String data is always read under controlled situations to avoid causing memory overruns. For this reason, this property is set to ERROR by default.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: ERROR
org.apache.commons.http client.wire.content	Logs the Content part of the HTTP wire-level protocol. The wire log is used to log all data transmitted to and from servers when they execute HTTP requests. This log should be enabled only to debug problems, as it produces an extremely large amount of log data, some of it in binary format. For more information, go to: http://jakarta.apache.org/commons/httpclient/logging.html for details. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO
org.apache.commons.http client.wire.header	Logs the header part of the HTTP wire-level protocol. The wire log is used to log all data transmitted to and from servers when they execute HTTP requests. This log should be enabled only to debug problems, as it produces an extremely large amount of log data. For more information, go to: http://jakarta.apache.org/commons/httpclient/logging.html Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO

commons-logging.properties: Traditional Log Tab

The table below lists properties that are specific to TraditionalLog, the default logger specified in the property org.apache.commons.logging.Log. TraditionalLog supports numerous features that other loggers might not support. In your Spark installation, you may choose to use a different logger with your own set of properties.

Properties in commons-logging.properties: Traditional Log Tab

Property	Description
logging.file	Specifies the full path to the log file. It is required and should be set to a different value for each VM to avoid conflicts. Note: This value must be specified or logging will fail.
logging.format	Specifies the java.text. SimpleDateFormat that will be used in timestamps that are written to the log file. Consult the API documentation for java.text.SimpleDateFormat for syntax information. If not specified, the default SimpleDateFormat will be used.
logging.maxlogsize	Specifies the maximum size of the log file in bytes. Once the log file grows to the size specified, it will either be rolled or deleted. Set it to -1 to allow the log to grow indefinitely.
	Default value: 10MB
logging.per-client-log	Specifies whether a log file will be kept for each distinct IP address that requests data from Content Server. This property allows the use of CatalogManager to retrieve the log file from a web browser.
	When this property is set to true, Content Server creates a log file for each browser IP address. Each file is stored in the same directory as the futuretense.txt file and is created according to the following naming convention: futuretense.IPaddress.txt. You can then use the exportlog argument of the CATALOGMANAGER tag to retrieve the log file for the IP address of the browser that you are using.
	Possible values: true false
	Note: Per-client logging is automatically disabled if the ContextAwareLogFactory publishing logger is enabled (i.e., the value of logging.per-client-log is ignored when org.apache.commons.logging.LogFactory is set to enable the ContextAwareLogFactory).

Properties in commons-logging.properties: Traditional Log Tab (continued)

Property	Description
logging.roll	Specifies how many logs will be kept when rolling the log file. Previous versions will be renamed and once all available versions are used, the oldest log will be deleted. Set to 0 to disable rolling of the log file. Set it to a positive integer to specify the number of logs to keep. Default value: 0
logging.timestamp	Specifies whether or not the timestamp will be written to the log file for each logging entry.
	Possible values: true false Default value: true

commons-logging.properties: User Defined Tab

By default, this tab contains the following properties:

Properties in commons-logging.properties: User Defined Tab

Property	Description
com.fatwire.logging.ui.	This logger is used by the user interface model components.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.ui. phase	This logger is used by DebugPhaseListener to display the phase of the JSF lifecycle.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL
	Default value: INFO
com.fatwire.logging.ui. view	This logger is used by the user interface view components. The intended use of this logger is in debugging user interface components and their lifecycle.
	Possible values: TRACE, DEBUG, INFO, WARN, ERROR and FATAL
	Default value: INFO

Properties in commons-logging.properties: User Defined Tab (continued)

Property	Description
com.fatwire.search. lucene	This logger is used by the Lucene integration. Possible values: TRACE, DEBUG, INFO, WARN, ERROR, FATAL Default value: INFO

CSPortletRequest.properties

The CSPortletRequest.properties file holds portal configuration properties that are set by the Content Server installation program.

The following tab is displayed (in the Property Editor) for the CSPortletRequest.properties file:

• User Defined Tab

Caution

Do **not** change the values of any properties on this tab.

CSPortletRequest.properties: User Defined Tab

Properties in CSPortletRequest.properties: User Defined Tab

Property	Value
cs.contenttype.UTF-8	text/html; charset=UTF-8
cs.charset	_charset_
cs.contenttype	text/html; charset=UTF-8
cs.disksize	102400

dir.ini

The dir.ini file contains properties that are used to configure the directory services options described below.

The dir.ini file is the main configuration file for Content Server's Directory Services API. Content Server uses this API to connect to directory servers for authentication/authorization services and to provide the following options for managing user information (one of the options is configured for your Content Server system):

- The Content Server directory services plug-in, which uses the native Content Server user management tables (SystemUsers and SystemUserAttrs).
- LDAP plug-ins, which uses the directory server rather than the Content Server database to store user names and attributes.

Properties in dir.ini are organized by function on the following tabs in the Property Editor:

- Attribute Names Tab
- Compatibility Tab
- Global Data Tab
- Interface Implementations Tab
- JNDI SPI Env. Tab
- Naming Syntax Tab
- Schema Defaults Tab
- Search Controls Tab
- User Defined Tab

Note

Although the dir.ini file is the main configuration file for the directory services API, there are additional user manager/directory services properties in another property file, futuretense.ini. See "Authentication Tab" on page 53.

dir.ini: Attribute Names Tab

The **Attribute Names** tab holds attribute-mapping properties. You use these properties to specify how a user attribute used by Content Server is identified in the directory server.

Properties in dir.ini: Attribute Names Tab

-1		
Property	Description	
cn	Specifies the name of the attribute in the directory server that serves as the group name attribute.	
	Possible values:	
	• Content Server and NT:	
	cn	
	• LDAP, iPlanet:	
	LDAP, Active Directory:	
	cn	
loginattribute	Specifies the name of the attribute in the directory server that serves as the user login attribute.	
	Default value: uid	
password	Specifies the name of the attribute in the directory server that serves as the password attribute.	
	Possible values:	
	Content Server and NT:	
	password	
	• LDAP, iPlanet: userPassword	
	LDAP, Active Directory:	
	password	
uniquemember	Specifies the name of the attribute in the directory server that serves as the group assignment attribute.	
	Possible values:	
	Content Server and NT:	
	uniquemember	
	• LDAP, iPlanet: uniquemember	
	• LDAP, Active Directory:	
	member	

Properties in dir.ini: Attribute Names Tab (continued)

Property	Description
username	Specifies the name of the attribute in the directory server that serves as the user name attribute.
	Possible values: Content Server and NT: username LDAP, iPlanet: uid LDAP, Active Directory: samaccount.
memberof	Specifies the name of the user attribute that contains information about the user's groups. If a user's membership in a group is specified by the uniquemember attribute on the group, leave this property blank. If the group membership of a user is specified by an attribute of the user, specify the name of that attribute here. Possible values: LDAP, WebLogic embedded LDAP: wlsmemberof LDAP, SunONE Identity Server: memberof

dir.ini: Compatibility Tab

The **Compatibility** tab holds properties that determine how any strings that are extracted from the directory server and stored in the Content Server database are treated.

Properties in dir.ini: Compatibility Tab

Property	Description
cleandns	Specifies how the strings for distinguished names are stored in the Content Server database.
	If set to true, the Directory Services API extracts distinguished names from the directory server, and then removes extra spaces from them and then changes all the upper-case letters to lower-case letters before storing the strings in the Content Server database.
	Possible values: true false
	Default value: false
	Note: Do not set this value to true if you are upgrading from an earlier version of Content Server. If you do, you must manually change any existing dns strings that are stored in the Content Server tables. Also, if you set it to true, you must also verify that the syntax.ignorecase property is also set to true.

dir.ini: Global Data Tab

The Global Data tab holds properties that determine global values for all users.

Properties in dir.ini: Global Data Tab

Property	Description
baseDN	Specifies the distinguished name for the root to use by default for searches and for prepending to the names for attribute values that require a DN type.
	Default value: blank
	Do not change the value of this property. Because the authentication module sets the currentUser session variable to a fully qualified name, Content Server assumes that all names returned from the search are fully qualified.
groupparent	Specifies the entry to use as the parent of all Content Server entries of type Group.
	Possible values:
	Content Server and NT:
	ou=groups • LDAP, iPlanet:
	ou=groups,dc= <companyname>,dc=com</companyname>
	• LDAP, Active Directory:
	cn=groups,dc= <companyname>,dc=com</companyname>
peopleparent	Specifies the entry to use as the parent of all Content Server entries of type User.
	Possible values:
	• Content Server and NT:
	ou=people • LDAP, iPlanet:
	cn=people,dc= <companyname>,dc=com</companyname>
	• LDAP, Active Directory: cn=users,dc= <companyname>,dc=com</companyname>
	cii-users, uc-\companyname>, uc-com

dir.ini: Interface Implementations Tab

The **Interface Implementations** tab holds two properties that determine which user manager module your Content Server system is using. The values of the rest of the properties on the tab should never be modified.

Properties in dir.ini: Interface Implementations Tab

Property	Description
className.Attribute	Specifies the name of the concrete class to implement the interface Attribute.
	Do not change the value of this property.
className.Attributes	Specifies the name of the concrete class to implement the interface Attributes.
	Do not change the value of this property.
className.IDir	With the className. IName property, specifies which user manager module your system is using.
	Possible values:
	• Content Server: com.openmarket.directory.cs.CSDir
	• LDAP: com.openmarket.directory.jndi.JNDIDir
	Do not change the value of this property after the installation.
className.IFactory	Specifies the name of the concrete class to implement the interface Ifactory.
	Do not change the value of this property.
className.IName	With the className.IDir property, specifies which user manager module your system is using.
	Possible values:
	• Content Server:
	com.openmarket.directory.cs.CSName
	• LDAP: com.openmarket.directory.jndi.Name Wrapper
	Do not change the value of this property after the installation.

Properties in dir.ini: Interface Implementations Tab (continued)

Property	Description
className.IUserDir	Specifies the name of the concrete class to implement interface IUserDir.
	 Possible values: Content Server: com.openmarket.directory.cs.CSDir LDAP: com.openmarket.directory.jndi.LDAP UserDir
className.JNDIName	Specifies the name of the concrete class to implement the interface JNDIName. Do not change the value of this property.

dir.ini: JNDI SPI Env. Tab

The properties on the **JNDI SPI Env** tab are used only if your Content Server system is configured to use the LDAP user manager module.

Properties in dir.ini: JNDI SPI Env Tab

Property	Description
java.naming.factory. initial	Specifies the initial factory class to use. The value of this property should be the fully qualified class name of the factory class that will create an initial context. Do not change the value of this property.
java.naming.security. authentication	Specifies the security level to use. Its value is one of the following strings: none, simple, strong. If this property is unspecified, the security level is determined by the service provider. Default value: simple
jndi.baseURL	Specifies the server name and port number of the directory server. The value uses the following format: ldap:// <hostname>:<port></port></hostname>
jndi.connectAsUser	Specifies whether Content Server needs a designated user account to query the directory server for user attribute information. If set to true, jndi.connectAsUser specifies a Content Server login to the LDAP server. This means that Content Server queries the directory server for information as the user who is logged in to the CS system and is making the inquiry. For example, when an administrator examines user information in the Content Server interface, Content Server makes the inquiry as that user (admin, for example.) If set to false, jndi.connectAsUser specifies a direct login to the LDAP server. This means there must be a valid username/password combination specified for the jndi.login and jndi.password properties; Content Server uses that user account to make inquiries.
jndi.custom	System property. Do not enter a value for this property. Specifies other spi-specific variables to pass into the javax.naming.context. Syntax follows x-www-form-urlencoded format.

Properties in dir.ini: JNDI SPI Env Tab (continued)

Property	Description
jndi.login	Applies only when jndi.connectAsUser is set to false.
	Specifies the fully qualified, fully distinguished name of the user account that Content Server uses to query the directory server.
jndi.password	Applies only when jndi.connectAsUser is set to false.
	Specifies the password of the user account that Content Server uses to query the directory server. This value is encrypted.
jndi.poolConnections	Applies only when jndi.connectAsUser is set to false.
	If this property is set to true, the system will create a pool of DirContent connections.
	If set to false, jndi.poolsize is ignored.
jndi.poolsize	Indicates the size of the pool.
	Default value: 20
	This property is ignored if jndi.poolConnections is set to false.
syntax.custom	Specifies classJNDIName-specific variables to pass into the classIName constructor. Syntax follows x-www-form-urlencoded format.

dir.ini: Naming Syntax Tab

The **Naming Syntax** tab holds properties that determine how strings for user attributes and their values are interpreted.

Properties in dir.ini: Naming Syntax Tab

Property	Description
syntax.beginquote	Specifies the string that delimits the beginning of a quoted string.
	Default value: /
syntax.beginquote2	Specifies an alternative to the value specified for the syntax.beginquote property.
syntax.direction	Specifies the direction in which the components in a designated name are read.
	Possible values: left_to_right right_to_left flat
	Default value: left_to_right
syntax.endquote	Specifies the string that delimits the end of a quoted string.
	Default value:
syntax.endquote2	Specifies an alternative to the value specified for syntax.endquote.
syntax.escape	Specifies the escape string for overriding separators, escapes, and quotes.
	If you are using special characters, such as ',', '+', '-', 'i', etc., in DN, you cannot use \ as an escape string.
	Default value: \

Properties in dir.ini: Naming Syntax Tab (continued)

Property	Description
syntax.ignorecase	Specifies whether strings are case-sensitive or not.
	Set to false if the uppercase and the lowercase version of a letter character should be considered as different characters. (That is, "admin" and "Admin" should be interpreted as different words.)
	Set to true if you want the uppercase and the lowercase version of a letter character to be considered as the same character. (That is "admin" and "Admin" should be interpreted as the same string.)
	Default value: true
	Note : If you need to set the cleandns property on the Compatibility tab to true, you must also set this property's value to true.
syntax.separator	Specifies the separator character used between atomic name components.
	This property is required unless syntax.direction is set to a value of flat.
	Default value: ,
syntax.separatorava	Specifies the separator character used to separate multiple attribute/value pairs. Typically the comma character (,) is used.
	Default value: ,
syntax.separatortypeval	Specifies the separator character used to separate an attribute from its value. For example, the equals symbol (=) is used.
	Default value: =
syntax.trimblanks	Specifies whether spaces and whitespace characters are significant or should be ignored (trimmed) when evaluating a string.
	Set to true if spaces should be ignored.
	Set to false if spaces should be considered when evaluating a string.
	Default value: false

dir.ini: Schema Defaults Tab

The **Schema Defaults** tab holds properties that identify the following entities to Content Server:

- The directory server attributes for which users must have values in order to be valid users
- Attribute values that are assigned to users by default (if any).

Properties in dir.ini: Schema Defaults Tab

Troportion in arr. Tim. Concina Belaute Tab	
Property	Description
defaultGroupAttrs	Specifies the attribute name/value pairs that are set for every descendent of the entry specified by the groupparent property.
	Content Server uses this information to create the default groups that it needs during the installation, which means that this property must be set before you install Content Server.
	Values must be entered in the x-www-form-urlencoded format.
defaultPeopleAttrs	Specifies the attribute name/value pairs that are set for every descendent of the entry specified by the peopleparent property.
	Content Server uses this information to create the default users that it needs during the installation, which means that this property must be set before you install Content Server.
	Values must be entered in the x-www-form-urlencoded format.
defaultReaderACLs	The ACL list to be assigned to DefaultReader by Login Module.
	Default value: Browser
objectclassGroup	Specifies the name of the base object that signifies a Content Server group. The DIR.GROUPMEMBERSHIPS tag uses the value set for this property to differentiate group entries from user or other entries.
	Possible values:
	Content Server:
	groupofuniquenames • LDAP, iPlanet:
	groupofuniquenames
	• LDAP, Active Directory: group

Properties in dir.ini: Schema Defaults Tab (continued)

Property	Description
objectclassPerson	Specifies the name of the base object that signifies a Content Server user (person). The DIR.LISTUSERS tag uses the value set for this property to differentiate user entries from group or other entries Value for Content Server or LDAP: person
requiredGroupAttrs	Specifies the attributes that every descendent of the entry specified by the groupParent property must have values for. Values must be entered in the x-www-form-urlencoded format.
requiredPeopleAttrs	Specifies the attributes that every descendent of the entry specified by the peopleParent property must have values for. Values must be entered in the x-www-form-urlencoded format.

dir.ini: Search Controls Tab

The **Search Controls** tab holds properties that constrain the queries that the user manager plug-in makes to the directory server.

Properties in dir.ini: Search Controls Tab

Property	Description
search.returnLimit	Specifies the maximum number of entries to return. To obtain all the entries that satisfy the search criteria, set the value to 0.
search.scope	Specifies to what depth in the hierarchy a search reaches: search just the specified or current node, or search the nodes under that node. Default value: 2 (which means search all nodes under the stated node)
search.timeoutVal	Specifies the number of seconds to wait for results before returning an error. A value of 0 means to wait indefinitely (that is, wait until the network timeout limit ends the wait).

dir.ini: User Defined Tab

Properties in dir.ini: User Defined Tab

Property	Description
Note: This ta	ab, by default, has no properties.

fatwire_settings.properties

The fatwire_settings.properties file holds the property that points to the e-mail address which will receive notices from WEM users about forgotten passwords.

fatwire_settings.properties: User Defined Tab

Properties: fatwire_settings.properties: User Defined Tab

Property	Description
forgotpassword	Specifies the e-mail address that should receive notices from users regarding forgotten passwords. This property sets the e-mail address for the Forgotten Password? link on WEM's "Login" page.
	Legal value: <e-mail address=""></e-mail>
	Default value: admin@localhost

futuretense.ini

The futuretense.ini file is the main property file for Content Server. Its properties are organized by function on the following tabs in the Property Editor:

- App Server Tab
- Authentication Tab
- Basic Tab
- Blob Server Tab
- Cluster Tab
- Compatibility Tab
- Content Tables Tab
- Database Tab
- Debug Tab
- Email Tab
- Export/Mirror Tab
- JSP Tab
- Misc Tab
- Page Cache Tab
- ResultSet Cache Tab
- Satellite Server Tab
- Search Tab
- User Defined Tab

futuretense.ini: App Server Tab

The **App Server** tab holds the futuretense.ini properties that supply information to Content Server about the application server.

Properties in futuretense.ini: App Server Tab

Property	Description
cs.eventhost	The host string for running the event engine on application servers. In a clustered environment, this property must be set on each cluster member and point to either the primary cluster member or to the cluster member, itself. The second option provides for failover.
	Legal value: http:// <hostname>:</hostname>
ft.cgipath	The web server CGI directory where Content Server objects are installed.
	Used in the constructions of URLs and form actions.
	Be sure the value ends with a forward slash (/).
	Possible values:
	/NASApp/CS/ – when using the Sun ONE application server (iAS); the path is defined to be the path used when installing Sun ONE.
	/servlet/ - in http servlet application environments (such as WebLogic).

futuretense.ini: Authentication Tab

The **Authentication** tab holds user authentication properties that are configured during installation based on the user manager plug-in in use on your Content Server system. Some of these properties apply no matter which user management module you are using while others apply only if you are using NT authentication.

See also, the main configuration file for the user manager plug-ins is the dir.ini file. See "dir.ini" on page 36.

Properties in futuretense.ini: Authentication Tab

Property	Description
cs.manageACL	Specifies the class that replaces the default Content Server ACL name-to-privilege mask function. Do not change the value of this property.
cs.manageproperty	Specifies the name of the appropriate property file that configures the NT authentication plug-in or the LDAP plug-in, depending on whether you are using either of these user manager modules. • For NT, set the value to: futuretense.ini • For LDAP, set the value to: dir.ini
cs.manageUser	 Specifies which user manager plug-in to use with this CS system. If you are using the default Content Server plug-in, the value is blank. If you are using LDAP, the value is: com.openmarket.directory.jndi.auth.JNDILogin If you are using NT authentication, the value is: com.FutureTense.NTUserGroups.Valida teLogin.NTUserGroupsLogin This property was set when your CS system was installed. Do not change it after installation.
cs.manageUserAccess	Specifies the class that replaces the default Content Server user-to-privilege-by-resource lookup functionality. Do not change the value of this property.

Properties in futuretense.ini: Authentication Tab (continued)

Property	Description
cs.manageUserSystem	Applies only when your CS system is using NT authentication (that is, cs.manageUser points to the NT plug-in).
	Specifies a comma-separated list of NT domain names that Content Server uses to authenticate users.
	Authentication is done in the order specified by the list of domains. A user is declared a valid user if his username/password combination is found in any of those domains.
	Specify the local system with a period (.) character.
	If the cs.manageUser points to the NT plug-in, but there are no domain names set for this property, Content Server attempts authentication on the local NT domain only.
	This value was set during installation.
cs.ssovalidator	This property points to the SSO validator plugin.
	If WEM is installed, the default value is:
	com.fatwire.wem.sso.cas.cs.plugin. SSOValidatorPlugin
ntlogin.DefaultACL	NT user manager plug-in only.
	A comma-separated list of any ACLs that should be assigned to all users by default.
	By default, this value is blank.
ntlogin.DefaultReaderACL	NT user manager plug-in only.
	The ACL list to be assigned to the account that is used as the default reader account.
	By default, this value is blank.
ntlogin.DefaultReaderID	NT user manager plug-in only.
	The user name to be used as the default reader account.
	By default, it is set to DefaultReader.
	This value can be blank.

Properties in futuretense.ini: Authentication Tab (continued)

Property	Description
ntlogin.DefaultReaderPW	NT user manager plug-in only. The password for the user name that the NT authentication module uses as the default reader account. Required if there is a value for ntlogin.DefaultReaderID. By default, it is set to SomeReader. The value is encrypted.
ntlogin.LogFile	NT user manager plug-in only. The complete path to the file where debug information from the NT authentication module should be written. (Used only when ntlogin. Logging is set to true.)
ntlogin.Logging	NT user manager plug-in only. Enables or disables debugging for the NT authentication module. Possible values: true false
singlesignon	If set to true, enables single sign-on for an authentication plugin that supports single sign-on. If WEM is installed, this property is set to true.

futuretense.ini: Basic Tab

The **Basic** tab holds the futuretense.ini properties that control such things as security settings, session timeouts, and Global Unique Identifiers that the Content Server servlets use.

Properties in futuretense.ini: Basic Tab

.,	
Property	Description
bs.security	Specifies whether the BlobServer servlet checks security before allowing database access and image retrieval. If security is on, images cannot be cached in memory.
	If you enable BlobServer security, the BlobServer servlet serves the data only if the csblobid parameter exists in the URL and its value matches a session variable of the same name, as in the following example:
	<pre></pre>
	Possible values: true false
cc.security	Specifies whether Content Server checks security before allowing database access. This property should always be set to true except in special cases.
	Possible values: true false
cs.barEqualsSlash	Specifies whether an Internet Explorer browser should interpret the bar () character as a forward slash (/) when it is included in a page name.
	Possible values: true false
	For example, when set to true, Internet Explorer interprets pagename=folder subfolder page as the same page as pagename=folder/subfolder/page
	Default value: false
cs.session	Specifies whether Content Server starts and maintains a browser session for each user.
	Possible values: true false
	Cannot be set to false when the cc.security property is set to true.

Properties in futuretense.ini: Basic Tab (continued)

Property	Description
cs.timeout	Specifies the number of seconds a connection can remain idle before the application server logs out this connection, which ends a browser session. Idle time is the time between Content Server http requests.
	Default value: 300 (5 minutes)
	Note: When the approval system approves assets, it is not a background process. Therefore, if you use the Approve Multiple Assets feature, be sure to set this property to a value that is greater than the amount of time it takes to approve a batch of asset so that the browser session does not time out. You will have to experiment with this setting, but you can start by setting it to 1800 seconds (30 minutes).
cs.uniqueidpoolsize	Specifies the number of unique and cluster-safe ID numbers that are cached at one time. (Content Server generates unique IDs for every row in any database table.)
	Default value: 100
cs.wrapper	Deprecated . Specifies whether the Content Server HTML wrapper pages should (can) be used.
	Default value: true
	Set this value to false on a CS system in which the application server does not have HTTP access to the web server, or, if you have removed the directory that holds the wrapper pages for security reasons.
	See also the Content Server Administrator's Guide.
ft.version	Specifies the version number of the Content Server application.
	Do not modify this value.
secure.CatalogManager	Specifies whether the DefaultReader user can access the CatalogManager servlet.
	Possible values: true false
	During installation, this property is set to false. Be sure that this value is changed to true after the installation.
	For more information, see the Content Server Administrator's Guide.

Properties in futuretense.ini: Basic Tab (continued)

Property	Description
secure.DebugServer	Controls whether DefaultReader can connect to the specified servlet when security is on. If set to true, DefaultReader cannot connect.
	Possible values: true false
secure.TreeManager	Specifies whether the DefaultReader user can access the TreeManager servlet.
	Default value: true
	For more information, see the <i>Content Server Administrator's Guide</i> .

futuretense.ini: Blob Server Tab

The **BlobServer** tab holds properties that configure the BlobServer servlet. BlobServer serves blobs. It gathers a blob from a table and performs all the necessary security checks. When BlobServer serves a blob, it caches it in both Content Server and Satellite Server.

Properties in futuretense.ini: Blob Server Tab

Property	Description
bs.bCacheSize	Specifies the default number of blobs that can be cached (to memory).
	Default value: 100
bs.bCacheTimeout	Specifies the number of seconds that a blob will remain cached in memory. Note that the memory cache is cleared whenever the BlobServer servlet is restarted.
	This property affects the operation of CacheManager as follows:
	When compositional dependencies are recorded against a blob in the SystemItemCache table, they are configured such that they will be removed from the table after the blob expires from the cache. This prevents excessive growth of the SystemItemCache table. However, removing the entry from the table disables CacheManager from removing the corresponding blobs from the Tier 2 cache, and users will view stale data.
	Possible values: negative integer, 0, positive integer
	Default value: -1
	The blob will remain cached in memory forever, unless it is evicted because more recently used blobs have filled the cache.
	Note: The value of this property affects cs.manage.expired.blob.inventory as follows:
	 A value of 0 or less causes cs.manage. expired.blob.inventory to have no effect. A positive integer with cs.manage.expired. blob.inventory set to true ensures that CacheManager operates correctly, but at the cost of growth in the SystemItemCachetable.
	For more information about cs.manage.expired.blob.inventory, see page 85.

Properties in futuretense.ini: Blob Server Tab (continued)

Property	Description
bs.invalidheadernames	Comma separated list of invalid headers which are ignored by BlobServer. Default value: Set-Cookie
cs.recordBlobInventory	Specifies whether compositional dependencies should be recorded against blobs. This property must be set to true (the default) for CacheManager to operate on blobs. Possible values: true false
	Default value: true

futuretense.ini: Cluster Tab

The **Cluster** tab holds the properties that Content Server uses to communicate with all the servers in a cluster when a Content Server system is installed in a cluster.

Properties in futuretense.ini: Cluster Tab

Property	Description
cc.cacheNoSync	Specifies whether the system allows the database query transaction data cached by Content Server to persist even if a cluster member updates the table.
	Default value: false
	You can set table-specific values for individual tables by adding a property in the following format:
	cc. <sometable>CSync=<true false="" or=""></true></sometable>
ft.sync	An identifier or value that defines the synchronizer key for clustered servers; for example, the DSN that cluster members use for their shared database. Each cluster member must have the same ft.sync value.
	When set to true or yes, sync is enabled and extra asset-level locking is in effect. This mode is intended for clustered editorial systems, as it uses an asset-locking mechanism designed for frequent changes to assets.
	When set to a value other than true or yes, sync is enabled but extra asset-level locking is not in effect. This mode is intended for clustered delivery systems, as it enables an asset-locking mechanism designed for infrequent changes to assets.
	Note: FatWire recommends that you specify a value for ft.sync.
	Legal values: <string> <blank></blank></string>
ft.usedisksync	Specifies a shared file system folder to synchronize data across a cluster. Set this property to a valid folder when synchronization is turned on with the ft.sync property. For example, set it to a directory where you have read/write access.

futuretense.ini: Compatibility Tab

The **Compatibility** tab holds properties that set values necessary for backward compatibility with earlier versions of Content Server.

Properties in futuretense.ini: Compatibility Tab

Property	Descriptions
cs.cookievariables	Specifies if cookie variables should be created for servlet request information. For Content Server V5.5 compatibility specify true, otherwise specify false.
	Generating cookie variables can confuse page criteria for page requests and only works for outer pages.
cs.dataindatabase	Specifies whether large data should be saved in the database or in the file system as an upload column.
cs.httpvariables	Deprecated.
	Specifies whether the Content Server variables that contain HTTP header information are created on each page request, as was necessary in pre-4.0 versions of the product. Starting with 4.0, Content Server provides built-in variables that perform the same function.
	Default value: false
	For best performance, leave this value set to false. If developers need to retrieve an http variable for a site page, they can retrieve the value of the ones they need by using the built-in variables.

Properties in futuretense.ini: Compatibility Tab (continued)

Property	Descriptions
cs.pgcachefolder	For backward compatibility.
	In previous versions, when cache information is specified in the cacheinfo column for a SiteCatalog page entry, it pointed to this property. This property specified the default directory location where Content Server pages would be cached.
	Starting in version 5.0, Content Server pages are cached in the database, not to a directory. The value in the cacheinfo column now starts with a value of true or false, which determines whether the page is cached or not.
	For backward compatibility, if the value in the cacheinfo column of a SiteCatalog page entry follows the old syntax, the CacheManager caches Content Server pages using the old methodology.
	Therefore, if the SiteCatalog page entries on your system have not yet been updated to use the new syntax (which invokes the new caching behavior), this property must be set to a valid directory.
cs.satellitehosts	Specifies the host names of the servers that are hosting Satellite servlets that the CacheManager on this server (the one that hosts Content Server) needs to communicate with.
	Enter a comma-separated list of host names. The value for each host must include the path to the Content Server servlets.
	Use the following format:
	http://hostname:port/servlet/
	You can use https or special ports, if necessary. If required by your configuration, be sure to specify a fully-qualified domain name.
	The Satellite servlet that resides on this server is listed by default.

Properties in futuretense.ini: Compatibility Tab (continued)

Property	Descriptions
cs.satellitepassword	Specifies the passwords for the user accounts specified by the cs.satelliteusrs property. Note that the password for the Satellite servlet on this server is listed by default.
	The value of this property is encrypted as a single string. Therefore, when you edit the value of this property, you must enter all the passwords for all the Satellite servlet hosts, including the comma delimiter.
	Enter a comma-separated list of passwords in the order that matches the order in which you enterthe corresponding users for the cs.satelliteusers property. Be sure that the order of this list also matches the order of the list of host names provided for the cs.satellitehosts property.
cs.satelliteusers	Specifies the user names for the Satellite Server hosts. Note that the user name for the Satellite servlet on this server is listed by default.
	Enter a comma-separated list of user names in the order that matches the list of passwords that you specified for the cs.satellitepassword property.
cs.selfmodify	Specifies a comma-separated list of attributes that a user is allowed to modify.
	Currently, only password is supported.
	For complete backward compatibility, set the property to blank to ensure that the user has write privileges to the SystemUsers table.
cs.xmlHeaderAutoStream	Tells Content Server whether it should stream the XML header as defined in the property cs.xmlHeader as the first content of the response, automatically, or not.
	If this property is set to true, then CS will automatically insert the header into the response. If it is set to false, then CS will not do anything. If the response is not a SOAP response, this property is ignored entirely and the header is never inserted.
	Default value: false
	For backward compatibility with CS 6.1 and earlier, set this property to true.

Properties in futuretense.ini: Compatibility Tab (continued)

Property	Descriptions
ft.approot	Deprecated. This property is no longer used. In some cases, it may be required for backward compatibility.
ft.catalogmanager	Defines the Global Unique Identifier (GUID) for the CatalogManager service. It is provided for reference only.
	Default value: {40DD4E30-8DE2-11D1-8599-0080C7D07E91}
	Do not modify this value.
ft.contentserver	Defines the GUID for the Content Server servlet. It is provided for reference only.
	Default value: {29434AD0-8DE2-11D1-8599-0080C7D07E91}
	Do not modify this value.
ft.treemanager	Defines the GUID for the Treemanager servlet. Do not modify this value.
security.checkpagelets	Specifies whether Content Server checks security before allowing a user to view a pagelet that is nested in an enclosing page.
	Note that the cc. security property must also be set to true for security to be implemented.
	Default value: true
	If set to false, the following occurs:
	 On systems with co-resident Satellite Server, security is not checked on any pages or pagelets, even with cc.security set to true. On systems with stand-alone Satellite Server or with Content Server only, security is checked on the first or outermost page but security is not checked on nested pagelets.

futuretense.ini: Content Tables Tab

The **Content Tables** tab holds a property that specifies the default primary key column for all of the content tables (as opposed to object tables) in your Content Server database.

If you or your developers create any content tables to support your online sites, you can specify that a column other than the one specified by the default is the primary key column for those content tables by creating table-specific properties. Use the following format:

cc.<name of table>Key=<name of column>

For example, when Content Server installs the Category table (which is used by basic asset types), it creates a property named cc.CategoryKey. The cc.CategoryKey property and any new property that you create appears on the **User Defined** tab rather than the **Content Tables** tab.

Caution

Do not change the key value specified for any of the Content Server content tables.

The following table describes the content table property:

Properties in futuretense.ini: Content Tables Tab

Property	Descriptions
cc.contentkey	Specifies the name of the column that serves as the primary key for content tables in the Content Server database. This is a default setting that applies to any content table that does not have a table-specific property that sets a different primary key for it.
	Value set during installation of the CS content applications: id
	Caution: Do not change the value of this property. If you change it, the CS content applications will not function.
	To specify a different primary key for an individual content table, create a table-specific key property as described in the paragraphs preceding this table.

futuretense.ini: Database Tab

The **Database** tab holds both the general database configuration properties such as database name and user access properties, and vendor-specific properties such as how the database interprets date/time values.

Database properties must be set to the same values on each of the systems in your Content Server system—development, management, and delivery—so that you can move assets and other work from one system to another.

Note

Database properties are set during Content Server installation. If you need assistance with determining property values or setting them during the installation process, contact FatWire Technical Support. Do **not** change the values of these properties after Content Server is installed.

If you are unsure about how property values were determined, check with your database administrator or the individual who installed Content Server.

Properties in futuretense.ini: Database Tab

Property	Description
cc.bigint	Specifies the SQL string for defining a 64-bit integer field.
	Possible values:
	• Oracle: NUMBER(38)
	• SQL Server: BIGINT
	• DB2: BIGINT
	See also the note above this table.
cc.bigtext	Specifies the SQL string for defining a large text field.
	Possible values:
	Oracle: CLOB
	• SQL Server: TEXT
	• DB2: Long varchar
	See also the note above this table.
cc.blob	Specifies the SQL string for defining a BLOB (binary large object) field.
	Possible values:
	Oracle: BLOB
	SQL Server: IMAGE
	• DB2: Long varchar for bit data
	See also the note above this table.

Properties in futuretense.ini: Database Tab (continued)

Property	Description
cc.char	Specifies the SQL string for defining a CHAR data type.
	Possible values:
	Oracle: CHAR
	SQL Server: CHAR
	SQL Server, multi-lingual Unicode: NCHAR
	• DB2: CHAR
	See also the note above this table (page 67).
cc.datepicture	Specifies how Content Server creates a date/time literal.
	Default value: {ts `\$date'}
	See also the note above this table (page 67).
cc.datetime	Specifies the SQL string for defining a date/time field.
	Possible values:
	Oracle 8: DATE
	• Oracle 9: TIMESTAMP
	• SQL Server: DATETIME
	• DB2: TIMESTAMP
	See also the note above this table (page 67).
cc.double	Specifies the SQL string for defining a double field.
	Possible values:
	• Oracle: NUMBER(38,10)
	• SQL Server: NUMERIC(28,10)
	• DB2: FLOAT
	See also the note above this table (page 67).
cc.forcelower	Specifies whether the column names for the tables that Content Server creates have all lowercase letters.
	Possible values:
	• Oracle: true
	• SQL Server: false
	• DB2: true
	See also the note above this table (page 67).

Properties in futuretense.ini: Database Tab (continued)

Property	Description
cc.ignoreTblCase	Determines whether Content Server ignores case when assessing table names.
	Possible values: yes no
	For example, if "tablename" and "TABLENAME" would be considered different tables in your database, set this value to no.
	Possible values:
	Oracle: yes
	• SQL Server: yes
	• DB2: yes
	See also the note above this table (page 67).
cc.integer	Specifies the SQL string for defining a 32-bit integer field.
	Possible values:
	• Oracle: NUMBER(10)
	• SQL Server: INT
	• DB2: INTEGER
	See also the note above this table (page 67).
cc.maxvarcharsize	Specifies the maximum size of a varchar column for your database.
	Possible values:
	• Oracle: 2000
	• SQL Server: 8000
	• DB2: 4000
	See also the note above this table (page 67).
cc.null	Specifies the SQL string for defining a field which allows NULL values; this is nonstandard, though most databases support NULL.
	Possible values:
	Oracle: NULL
	• SQL Server: NULL
	• DB2: blank
	See also the note above this table (page 67).

Properties in futuretense.ini: Database Tab (continued)

Property	Description
cc.numeric	Specifies the SQL string for defining a numeric field.
	Possible values:
	Oracle: NUMBER
	• SQL Server: NUMERIC
	• DB2: NUMERIC
	See also the note above this table (page 67).
cc.primary	Specifies the SQL string that defines a primary key.
	Possible values:
	• Oracle: PRIMARY KEY NOT NULL
	• SQL Server: PRIMARY KEY NOT NULL
	• DB2: primary key not null
	See also the note above this table (page 67).
cc.queryablemaxvarcharlen gth	Specifies the maximum size of a varchar column that can be queried based on the database driver in use.
	Oracle Thin: 255 Oracle Type II: 2000
	Oracle TypeII: 2000SQL Server: 255
	• DB2: 255
cc.rename	Specifies the SQL string that renames a table in the database, as required by your database vendor.
	Possible values:
	• Oracle: rename %1 to %2
	• SQL Server: execute sp_rename %1,%2
	• DB2: rename %1 to %2
	See also the note above this table (page 67).
cc.smallint	Specifies the SQL string for defining a 16-bit integer field.
	Possible values:
	• Oracle: NUMBER(5)
	• SQL Server: SMALLINT
	• DB2: SMALLINT
	See also the note above this table (page 67).

Properties in futuretense.ini: Database Tab (continued)

Property	Description
cc.stringpicture	Specifies how Content Server creates a string literal.
	Possible values:
	Oracle: \\$string'
	• SQL Server: `\$string'
	• SQL Server, multi-lingual Unicode:
	N `\$string' • DB2: `\$string'
	See also the note above this table (page 67)
cc.unique	Specifies the SQL string for defining a unique field.
	Possible values:
	Oracle: UNIQUE NOT NULL
	SQL Server: UNIQUE NOT NULL
	• DB2: UNIQUE NOT NULL
	See also the note above this table (page 67).
cc.varchar	Specifies the SQL string for defining a VARCHAR data type.
	Possible values: VARCHAR, for all supported databases except SQL Server, multi-lingual Unicode which is set to NVARCHAR
	See also the note above this table (page 67)
cs.dbconnpicture	Specifies the format of the database connection string used by JNDI datasources:
	• WebLogic 6.1: \$dsn
	• SunOne: jdbc/\$dsn
	• WebSphere 4.0: \$dsn
	See also the note above this table (page 67).
cs.dbtype	Defines the type of database to which you are connecting.
	See also the note above this table (page 67)
cs.dsn	Contains the database JNDI data source name for connecting to your database.
	See also the note above this table (page 67)

Properties in futuretense.ini: Database Tab (continued)

Property	Description
cs.privpassword	Specifies the password for the database account name used for read/write access (cs.privuser). The value is encrypted.
cs.privuser	Specifies the database account name to use for read/write access to the database. For security reasons, be sure that your system is not using the default user name/password combination.
	Default value: ftuser (set during installation)

futuretense.ini: Debug Tab

Note

For information about enabling debug logging, see "commons-logging.properties" on page 22. See also "Error Logging and Debugging" in the *Content Server Developer's Guide*.

If you enable debug logging, note the following:

- Delete or archive the futuretense.txt file frequently, because a large log file can affect Content Server performance.
- By default, all debug log messages go into a single log file, which can make debugging more difficult. To put debug messages into a separate log file, set the logging.per-client-log property to true. The property is defined on page 32.

Properties in futuretense.ini: Debug Tab

Property	Description
ft.debugport	Deprecated . Specifies the port that DebugServer uses to communicate with the template debugger utility. The port number must be greater than 1024.
	Default value: 1025
ft.suppressPasswords	Prevents any input or session variables containing the strings "password" or "PASSWORD" in their names from being logged.
	Default value: true
	Specify false to include passwords in the log.
ft.suppressPasswordNames	Specifies variable names that are used as passwords and should be suppressed when ft.suppressPasswords is set to true.
	The Cheetah installer now sets this property to: REMOTEPASS; pubtgt: factors; factors to suppress its mirror publish target passwords in the log.

futuretense.ini: Email Tab

The **Email** tab holds the properties that configure the Content Server e-mail system features. Note that in futuretense_xcel.ini, an additional property on the **Preference** tab enables the Content Server workflow e-mail system to send notices to workflow participants when they are assigned assets through a workflow process.

Properties in futuretense.ini: Email Tab

Property	Description
cs.emailaccount	Specifies the user account name to be used for sending outgoing mail. This is the account name on the SMTP server.
	If SMTP authentication is required, you must set a value for this property.
cs.emailauthenticator	Specifies the class that is used as the authenticator for mail operations.
	Default value: com.openmarket.framework.mail. ICSAuthenticator
cs.emailcharset	Specifies the default character set that is used for the text in the subject of an e-mail message.
	Examples:
	• Latin1: ISO-8859-1
	• Japanese (Shift_JIS): Shift_JIS • UTF-8: UTF-8
	If this property is blank, its value reverts to the default UTF-8.
cs.emailcontenttype	Specifies the default character set that is used for the text in the body of an e-mail message.
	Examples:
	• Latin1: text/html; charset=ISO-8859-1 • Japanese (Shift_JIS): text/html; charset=Shift JIS
	• UTF-8: text/html; charset=UTF-8
	If this property is blank, its value reverts to the default text/plain.
cs.emailhost	Defines the SMTP (e-mail server) host that is used by the ContentServer servlet to create and deliver e-mail messages.
	A valid value is required to send or receive mail.

Properties in futuretense.ini: Email Tab (continued)

Property	Description
cs.emailpassword	Specifies the password for the e-mail account used by Content Server (specified by cs.emailaccount). A valid value is required to receive mail.
cs.emailreturnto	Specifies the e-mail address from which mail is sent. That is, the e-mail address that appears in the From field of an e-mail message. Use one of the following formats: user@domain.com Full Name <user@domain.com></user@domain.com>
	A valid value is required to send mail.

futuretense.ini: Export/Mirror Tab

The **Export/Mirror** tab holds the properties that configure the Content Server Export and Mirror APIs that are used by the Content Server publishing system. These properties work in conjunction with the properties located on the **Publishing** tab in the futuretense_xcel.ini file (described in the "Content Server Property Files" section).

When configuring the publishing operations for your Content Server systems, think of your individual systems (development, management, delivery) in the following terms:

- Source, which denotes the Content Server database that is the source for a publishing session. Because you can mirror assets and site configuration information from any Content Server system to any other Content Server system, the source is not necessarily the Content Server management system.
- **Target**, which denotes either the Content Server database that you are mirroring to or the file server that you are exporting to.

For more information about publishing, see the Content Server Administrator's Guide

Properties in futuretense.ini: Export/Mirror Tab

Property	Description
cs.mirrorhttpversion	Specifies the HTTP protocol version to use to communicate with the Content Server target databases.
	Default value: 1
cs.mirrorpassword	Specifies the password for the mirror user on the target systems to which this system publishes. You set this value when you set up your CS system for publishing.
	For information, see the Content Server Administrator's Guide.
cs.mirrorproxyserver	Specifies the firewall server's IP address or name for the target system that this (source) system publishes to when the target and the source are separated by a firewall. You set this value when you set up your CS system for publishing.
	Possible values:
	your_server_name Of your_server_ip_address
	For information, see the Content Server Administrator's Guide.

Properties in futuretense.ini: Export/Mirror Tab (continued)

Property	Description
cs.mirrorproxyserverport	Specifies the port number of the firewall server for the CS system that this system publishes to when the target system is separated from the source with a firewall. You set this value when you set up your CS system for publishing.
	Possible values: port_number
	For information, see the Content Server Administrator's Guide.
cs.mirrorrowsperpost	Specifies the number of table rows that can be mirrored during each HTTP POST during a mirror operation
	If you are mirroring data that contains URL fields, you should set this to a low number because web servers impose a limit on the size of post packets.
	If you are mirroring data that contains only text, you can set this to a higher number.
	Default value: 6
	Note: For best performance, do not increase the value above 12. If your database is configured for UTF-8 and holds non-ASCII content, you must set this value to 4 or lower.
cs.mirrorthreads	Specifies the number of threads to allocate to a mirror operation.
	Default value: 2
	Note: For best performance, do not increase the value above 8.
cs.mirroruser	Specifies the name of the mirror user on the target system that this (source) system publishes to. You set this value when you set up your system for publishing.
	For information, see the Content Server Administrator's Guide.
cs.pgexportfolder	Specifies the base export directory for the HTML files that are created when assets are published with the Export to Disk delivery type.
	• Windows NT example: c:/FutureTense/export
	• Solaris example: /export/home/FutureTense/pgexport

futuretense.ini: JSP Tab

The **JSP** tab holds the properties that supply information that Content Server references when serving Java Server Pages files. If your Content Server system uses WebLogic, note that there are additional, WebLogic-only, JSP properties in the <code>jsprefresh.ini</code> file. See "jsprefresh.ini (Deprecated)" on page 144.

Properties in futuretense.ini: JSP Tab

Property	Description
cs.jspclear	Configures the Content Server engine to delete any previously deployed JSP files and clear the application server's working folder (temp and class files) when the Content Server engine executes the first JSP deployed by Content Server. The working folder is defined by the application server. Possible values: true false
cs.jsppath	Specifies the virtual root (zone) for executing deployed JSP pages. This property is used in conjunction with cs.jsproot, so the two properties must be in sync.
	Default value: synchronized with the WebLogic setting for cs.jsproot and is set at installation.
	Note: Do not change the value of this property after installation.
cs.jsprefresh	When the Content Server engine deploys a new or changed JSP element, the application server may require special processing to complete the deployment of the JSP. In those cases, this property specifies the name of the class which completes the deployment. In other cases, it is left blank.
	For WebLogic 6.1, the default value is com.divine.wl6special. For others, the default is blank.
cs.jspresponsewrapper	Specifies whether the application server requires the PrintWriter when it runs a JSP element. The Content Server installation sets this to an appropriate value based on the type of application server you are using.
	Do not change the value of this property.

Properties in futuretense.ini: **JSP** Tab (continued)

Property	Description
cs.jsproot	Specifies the directory where the application server expects to find JSP files. Some application servers allow this value to be modified by using property settings. WebLogic defines weblogic.httpd.initArgs for its JSPServlet object.
	The cs. jsproot property is used in conjunction with cs. jsppath, so the two must be in sync and both are set at installation.
	Do not change the value of this property after installation.
cs.jspwork	Specifies the directory where class files are created by the application server when executing JSP pages. This is not a required property and can be left blank, but it is normally set at installation. For more information, see cs.jspclear.
cs.use.short.jsp.names	Some file systems impose a limit on the length of absolute paths. Using long JSP names on such file systems can result in file system errors.
	If you are using such a file system, set this property to true to use shortened JSP names.
	When this property is set to false, the JSP name will correspond to the element name.
	This property is set automatically by the CS installer; it should be changed only when absolutely necessary.
	Default value: false

futuretense.ini: Misc Tab

The **Misc** tab holds miscellaneous properties such as the amount of idle time a connection can have before Content Server logs out of a connection and whether Content Server loads cache synchronization processing.

Properties in futuretense.ini: Misc Tab

•	
Property	Description
cs.charset	Specifies a variable that can be included in HTML forms as a hidden variable. The variable, which gets set by the browser, specifies the text encoding of the form data that Content Server must process.
	Default value: _charset_
	Do not change the value of this property.
cs.contenttype	Specifies the default character set to use for HTTP headers (streaming text).
	Default value: text/html; charset=UTF-8
	Specify a value that is appropriate for the online site that your CS system is delivering.
	Examples:
	 Latin1: text/html; charset=ISO-8859-1 Japanese (Shift_JIS): text/html; charset=Shift_JIS
cs.disksize	Specifies the size limit in bytes for keeping uploaded files in memory while they are being posted. If an uploaded file is larger than the value specified, Content Server streams it to a temporary file until it is finished evaluating a page. This prevents excessive memory use and helps to prevent denial-of-service attacks. Default value: 102400
	Default value: 102400
cs.documentation	Specifies the URL of the CS documentation.
	By default, this property is set to a FatWire documentation web site.
	If you prefer, you can download the most recent documentation kit from that web site, install it somewhere on your network, and then set this property to point to that location rather than to the FatWire documentation web site.

Properties in futuretense.ini: Misc Tab (continued)

Property	Description
cs.HTTP_HOST	Specifies the HTTP host for CS systems on which the Web server does not reside on the application server machine (that is, it is a web connector installation), or in cases where an alternative web server is used to serve pages.
	Use one of the following formats: <hostname>:<port> <ipaddress>:<port></port></ipaddress></port></hostname>
	Default value: blank
cs.HTTP_PROTOCOL	Specifies the HTTP protocol for CS systems where the web server does not reside on the application server machine (that is, it is a web connector installation), or in cases where an alternative web server is used to serve pages.
	Possible values: http or https or blank
	Default value: blank, which means the protocol is assumed to be http

Properties in futuretense.ini: Misc Tab (continued)

Property	Description
cs.sitepreview	This property is used to control the behavior of Site Preview functionality. The value of this property determines the output of the filter tag (asset:filterassetsbydate) as explained below.
	Note: To use Site Preview on a content management environment, you must set this property to contentmanagement.
	Possible values: disabled, contentmanagement, delivery
	• If the value is set to disabled:
	- The filter tag will not filter. It will simply return the set of input assets.
	 Caching will not factor in start/end dates in the expiry time calculations. Date inputs to the templates will have no effect.
	• If the value is set to contentmanagement:
	- The filter tag will filter the input set of assets according to the given date. If the given date is null, the tag will use the current server date.
	 Pages whose rendering templates use the filter tag will not be cached.
	 For pages that do not use the filter tag, caching will work in the default manner and expiry time calculations will not factor in start/end dates.
	If the value is set to delivery:
	 The filter tag will ignore all dates passed to it and will use the current server date for filtering.
	 For pages that use the filter tag, caching will factor in start/end dates in the expiry time calculation.
	 For pages that do not use the filter tag, caching will work in the default manner and expiry time calculations will not factor in start/end dates.
	Default value: disabled

Properties in futuretense.ini: Misc Tab (continued)

Property	Description
cs.urlfilerollup	Determines how changes to the files for URL columns are tracked.
	When this property is set to true, the previous versions of the related file are tracked in a name sequence. For example, if a file called filename.txt has been edited three times, filename.txt is the oldest, filename, 1.txt is the next oldest version, and fsilename, 2.txt is the current version.
	When this property is set to false, the file name toggles between filename.txt and filename, 0.txt on alternate updates.
	Default value: false for WebLogic 7.1 true for WebLogic 6.1
cs.xmlfolder	Specifies the working directory for HTML filtering. That is, if elements on your system use the XMLFILTER tag, temporary files are written to this directory.
	Default value: \$HOME/FutureTense/xmltemp
cs.xmlHeader	This is the XML Header streamed out for SOAP responses.

futuretense.ini: Page Cache Tab

The **Page Cache** tab holds the properties that configure Content Server's page cache settings. Content Server's page cache is monitored and maintained by the CacheManager. Content Server caching enables you to cache both complete web pages and their individual components (or pagelets).

To set up page caching on a Content Server system, you configure properties for the CacheManager and the Satellite Server servlets. In addition, there are properties for configuring BlobServer, the servlet that serves blobs and caches blobs both through Content Server and the Satellite servlet.

For more information:

- Page caching see the page caching chapter in the *Content Server Developer's Guide*. This chapter describes how Content Server's Cache Manager, the Satellite servlets, and the BlobServer servlet interact and work together.
- Satellite Server properties see "Satellite Server Tab" on page 92 and "satellite.properties" on page 151.
- Resultset caching properties see "ResultSet Cache Tab" on page 88.
- BlobServer properties see "Blob Server Tab" on page 59.

Properties in futuretense.ini: Page Cache Tab

Property	Description
cs.alwaysusedisk	Specifies the default cache setting for page entries in the SiteCatalog table that have no information in their cacheinfo column.
	If set to yes, then each page served from Content Server is cached to disk (the database), unless the value in that page entry's cacheinfo column specifies that it not be cached.
	Default value: no
cs.expireonly	Controls how outdated pages are expunged from the cache.
	When this property is set to false, pages that need to be expunged from the cache are deleted immediately and synchronously, that is, the user must wait until all pages are deleted.
	When this property is set to true, pages that need to be expunged from the cache are marked for deletion, taken out of service, and then deleted at a later time by a cache cleanup event.
	Default value: true
	Possible values: true false

Properties in futuretense.ini: Page Cache Tab (continued)

Property	Description
cs.freezeCache	Specifies whether a cache maintenance event should regularly remove expired pages from the cache, or whether the expiration date of a page should be checked only when that page is requested.
	Set the value to yes if you do not want an event to regularly remove expired pages from the cache.
	Default value: no
cs.IItemList	Defines the file that is used for the ItemList interface that is used by the Cache Manager.
	The IItemList interface is used to record compositional dependencies in the page cache. When this property is set to a legal class, dependency items will be recorded against a page id in the SystemItemCache table. This enables CacheManager. An illegal value results in CacheManager having no effect.
	Default value: com.openmarket.xcelerate. publish.MyItemList
	Note: The default value is provided for reference only. Do not change the value of this property.
cs.manage.expired.blob. inventory	Controls whether the CacheServer servlet removes blobkey/compositional dependency mappings from the SystemItemCache table after the blobs expire from the local blobserver cache. (The CacheServer servlet is typically invoked every five minutes by the event engine.)
	Possible values: true false
	• true disables the CacheServer servlet from removing blobkey/compositional dependency mappings from the SystemItemCache table when the blobs expire.
	• false enables the CacheServer servlet to remove expired blob references from the SystemItemCache table when the blobs expire.
	Default value: false (to support backward compatibility)
	Note: How this property takes effect depends on the value of the bs.bCacheTimeout property. (See page 59.)

Properties in futuretense.ini: Page Cache Tab (continued)

Property	Description
cs.nocache	Provides you with the ability to disable all disk-based page caching (pages will still be cached in memory). Use this property to temporarily shut down page caching when you are debugging your site, but do not leave this value set to true on a live system. Default value: false
cs.pgCacheTimeout	Specifies the number of minutes that a page will exist in the page cache. A value of 0 (zero) disables timeout, which means pages never expire. However, no matter what the setting for this property, CacheManager refreshes a cached page if the publishing system reports that it published any of the assets on that page.
	Note: For CacheManager to work properly, this property must be set to 0. Otherwise, pages will expire, making it impossible for CacheManager to remove the corresponding entries from the Satellite Server cache, and users will view stale data.
	Default value: 0
cs.recordBlobInventory	Allows users to work with blob dependencies. To record blobs inventory, set the value of this property to true. If full backward compatibility with V5.0 is desired, set the value of this property to false.
cs.requiresessioncookies	Specifies whether session ID information can be held in cookies or whether Content Server must encode session data into the links.
	Set to true (the default) if Content Server expects session cookies to be enabled. This allows all pages to be cached and does not encode the session id into any links. A value of false enables URL rewriting, with a negative effect on page caching performance.
	Default value: true
cc.SystemPageCacheTimeout	Specifies the number of minutes a cached page is held in memory (cached pages are cached both to disk and to memory). Default value: 1440 (that is, 24 hours)

Properties in futuretense.ini: Page Cache Tab (continued)

Property	Description
cc.SystemPageCacheCSz	Specifies the maximum number of pages that can be cached in memory. Pages are cached both in memory and to disk (database). This property specifies the number of pages cached to memory, not to disk.
	Note: This property must not be set to -1.
	Default value: 10000
ss.flushall	Controls how Satellite Server cache is flushed.
	When this property is set to false (default), only outdated pagelets are flushed from the Satellite Server cache.
	When this property is set to true, the Satellite Server cache is flushed completely (when a single asset is updated).
	Default value: false
	Possible values: true false

futuretense.ini: ResultSet Cache Tab

The **ResultSet Cache** tab holds properties that configure Content Server's resultset caching. For information about resultset caching and queries on your Content Server system, see the *Content Server Developer's Guide*.

The **ResultSet Cache** tab holds the following properties:

- Global resultset caching properties, which are set during the Content Server installation process to enable resultset caching for *all* tables in the Content Server database. The same properties will be automatically applied to all tables that are subsequently created. The properties are:
 - cc.cacheResults: number of resultsets to cache in memory
 - cc.cacheResultsTimeout: length of time tokeep resultsets cached in memory
 - cc.cacheResultsAbs: method of calculating expiration time for resultsets in the resultset cache
- Table-specific resultset caching properties for system tables. These properties are automatically set during the Content Server installation process to override the global resultset caching properties named above. For example, the following table-specific properties are set for the ElementCatalog table: cc.ElementCatalogCSz and cc.ElementCatalogTimeout. The property values can be changed, or the properties can be removed (the resultset cache for the table will then use the values of the global properties).

Note

If you wish to override global resultset caching properties, you must do so on a pertable basis by creating the following table-specific properties in the futuretense.ini file for as many tables as necessary to implement your resultset caching strategy for each of your Content Server systems:

```
cc.<tablename>CSz=<number of resultsets>
cc.<tablename>Timeout=<number of minutes>
cc.<tablename>Abs=<true or false>
```

If an asset type is enabled for revision tracking, and you wish to cache the resultsets of asset versions, use the properties above, but add _t after <tablename>:

```
cc.<tablename>_tCSz=<number of resultsets>
cc.<tablename>_tTimeout=<number of minutes>
cc.<tablename>_tAbs=<true or false>
```

When you create resultset caching properties that are specific for any *user-defined* table in the Content Server database, those properties are displayed on the **User Defined** tab (described on page 98).

For information about page caching properties, see "Page Cache Tab" on page 84. For information about BlobServer caching properties, see "Blob Server Tab" on page 59.

Note

As of version 7.6 Patch 2, Content Server provides the option to store resultsets within the inCache framework instead of hash tables (the default caching medium). Both caching frameworks use Java memory. You can switch between frameworks by setting the rsCacheOverinCache property in futuretense.ini to either true or false. For more information, see rsCacheOverinCache, on page 102.

The following table describes properties on the **ResultSet Cache** tab.

Properties in futuretense.ini: ResultSet Cache Tab

Property	Description
cc.cacheResults	Specifies the default number of resultsets to cache in memory. Note that this does not mean the number of records in a resultset, but the number of resultsets.
	Caution: Unless you are debugging, do not set this property to 0 or -1. If you do, the Content Server interface will fail to save assets properly. (Setting this property to 0 or -1 disables resultset caching for all tables that do not have their own caching properties configured.)
	Possible values: <n> (number of resultsets)</n>
	Default value: 500
	Note: To set a different value for a specific table, create a property for that table using the following format: cc. <tablename>CSz=<number of="" resultsets=""></number></tablename>
cc.cacheResultsAbs	Specifies how expiration time for resultsets in the resultset cache is calculated.
	• If this property is set to true, the expiration time for a resultset is absolute. For example, if cc.cacheResultsTimeout is set to 5 minutes, then 5 minutes after the resultset was cached, it is flushed from the cache.
	• If this property is set to false, the expiration time for a resultset is based on its idle time. For example, if cc.cacheResultsTimeout is set to 5 minutes, the resultset is flushed from the cache 5 minutes after the last time it was requested rather than 5 minutes since it was originally cached.
	Note: To set expiration time for a specific table, create a property for that table using the following format: cc. <tablename>CAbs=<true false="" or=""></true></tablename>

Properties in futuretense.ini: ResultSet Cache Tab (continued)

Property	Description
cc.cacheResultsTimeout	Specifies the number of minutes to keep a resultset cached in memory.
	Setting this property to -1 means that there is no timeout value for tables that do not have their own caching properties configured.
	Possible values: <n> (in minutes), or -1 to disable timeout for tables that use this default property.</n>
	Default value: 5
	Note: To set timeout for a specific table, create a property for that table using the following format: cc. <tablename>Timeout=<number minutes="" of=""></number></tablename>
cc.ElementCatalogCSz	Specifies the number of resultsets to cache against the ElementCatalog table.
	For best performance this value should be set to the number of rows in the table.
	Default value: 1000
cc.ElementCatalogTimeout	Specifies the number of minutes to keep idle resultsets for the ElementCatalog table in the resultset cache.
	Use -1 to disable timeout.
	Default value: 60
cc.SiteCatalogCSz	Specifies the number of resultsets to cache against the SiteCatalog table.
	For best performance, this value should be set to the number of rows in the table.
	Default value: 1000
cc.SiteCatalogTimeout	Specifies the number of minutes to keep idle resultsets for the SiteCatalog table in the resultset cache.
	Use -1 to disable timeout.
	Default value: 60
cc.SystemACLCSz	Specifies the number of resultsets to cache against the SystemACL table.
	For best performance, this value should be proportional to the number of rows in the table.
	Default value: 25

Properties in futuretense.ini: ResultSet Cache Tab (continued)

Property	Description
cc.SystemACLTimeout	Specifies the number of minutes to keep idle resultsets for the SystemACL table in the resultset cache.
	Default value: -1 (which disables timeout for this table)
cc.SystemInfoCSz	Specifies the number of resultsets to cache against the SystemInfo table.
	For best performance, this value should be set to the number of rows in the table.
	Default value: 500
cc.SystemInfoTimeout	Specifies the number of minutes to keep idle resultsets for the SystemInfo table in the resultset cache.
	Default value: -1 (which disables timeout for this table)
cc.SystemUsersCSz	Specifies the number of resultsets to cache against the SystemUsers table.
	For best performance, this value should be proportional to the number of rows in the table.
	Default value: 100
cc.SystemUsersTimeout	Specifies the number of minutes to keep idle resultsets for the SystemUsers table in the resultset cache.
	Default value: -1 (which disables timeout for this table)
ft.filecheck	Specifies whether Content Server verifies the timestamp on data held in an upload field each time an item (like an element) with uploaded data is requested.
	On a management or delivery system, the same items are requested repeatedly and setting this value set to yes can slow the performance of the system. Set this property to no on management or delivery systems. You can set it to yes on a development system.
	Default value: no

futuretense.ini: Satellite Server Tab

The **Satellite Server** tab holds properties that describe how to communicate with any of the Satellite servlets (Satellite Server), whether they are running locally or on remote servers.

Additionally, because Satellite Server is installed by default on the server that hosts your Content Server application, each Content Server system also has a satellite.properties file that configures the local Satellite servlet. (Note that when Satellite Server is also running on a remote server, that server also has a satellite.properties file.) For information about the properties in that file, see "satellite.properties" on page 151.

The following table describes the properties on the server that hosts Content Server that support communications with all Satellite servlets.

The value for each property is a comma-separated list. The ordinal position of an item in the list is what associates the host, user name, and password for each Satellite servlet. For example, the third host named in cs.satellitehosts is accessed using the third user account named in cs.satelliteusers, giving the third password listed in cs.satellitepassword.

Properties in futuretense.ini: Satellite Server Tab

Property	Description
cs.PastramiEngine	Defines the name of the implementing class of the PastramiEngine interface. Leave this property null to disable this feature entirely. The standard value for this property is: com.divine.pastrami.PushEngine
satellite.blob.cache control.default	Specifies a default value for the cachecontrol parameter for the satellite.blob, and RENDER.SATELLITEBLOB tags and their JSP equivalents.
	Default value: blank
	Set this property to a value that is appropriate for the majority of your blobs, and then use the cachecontrol parameter with the satellite.blob and RENDER.SATELLITEBLOB tags to override this value for individual blobs.
	Use the following format to set a value:
	hours:minutes:seconds daysOfWeek/daysOfMonth/months
	For more information about this format, see the description of the expiration property in the section "satellite.properties" on page 151.

Properties in futuretense.ini: Satellite Server Tab (continued)

Property	Description
satellite.page.cache	Deprecated.
control.default	Specifies a default value for the cachecontrol parameter for the satellite.page, and RENDER.SATELLITEPAGE tags and their JSP equivalents.
	Default value: blank
	Set this property to a value that is appropriate for the majority of your pages and pagelets, and then use the cachecontrol parameter with the satellite.page and RENDER.SATELLITEPAGE tags to override this value for individual pages and pagelets.
	Use the following format to set a value:
	<pre><hours>:<minutes>:<seconds> <daysofweek>/<daysofmonth>/<months></months></daysofmonth></daysofweek></seconds></minutes></hours></pre>
	For more information about this format, see the description of the expiration property in the section "satellite.properties" on page 151.

futuretense.ini: Search Tab

All properties on the **Search** tab are deprecated.

The **Search** tab holds properties that Content Server uses to obtain configuration information about your third-party search engine, if your Content Server system uses one. If your organization purchased one of the search engine modules, it was installed when your Content Server system was installed.

Note

The **Search** tab displays properties for all supported third-party search engine modules. In this section, the properties are organized by search engine.

Properties in futuretense.ini: Search Tab

Property	Description
av.cjkquery	Deprecated. Specifies whether AltaVista must handle queries that use Chinese, Japanese, or Korean characters. Default value: no Set to yes if your CS system is localized for Chinese, Japanese, or Korean.
av.defaultindex	Deprecated. Specifies the AltaVista search index to open if none is specified as an XML parameter.
av.license	Deprecated. Specifies an explicit license value. This property exists only if you have obtained your own license for the AltaVista search engine. It replaces av.oemkeytype.
av.oemkeytype	Deprecated. Specifies one of the two embedded keys: For a management system, set this value to management to allow up to 5 million entries. You are not authorized to use this value on a delivery site where there is public access. For a delivery system, set this value to delivery to allow up to 250,000 entries. If you need more entries, you must obtain a specific license from AltaVista and use the av.license property instead of this one.

Properties in futuretense.ini: Search Tab (continued)

Property	Description
cs.searchengine	Deprecated. Specifies the search engine. Set this property toAV (valid for Content Server upgrades) or to verity. Default value: verity
searcheng.apidebug	Deprecated. Controls whether search engine API calls should be logged and their returned values recorded. Possible values: yes no
searcheng.debug	Deprecated. Controls whether debugging for the search engine connector implementation should be turned on or off. Possible values: yes no
searcheng.enginedebug	Deprecated. Controls whether debugging in the third party search engine implementation is on or off. Possible values: yes no
searcheng.keeptemps	Deprecated. Controls whether temporary files used by the search engine implementation are kept or not. Possible values: yes no
searcheng.querydebug	Deprecated. Determines if the constructed query is written to the log before making the search. Possible values: yes no
searcheng.regdebug	Deprecated. Controls whether failed search engine registration attempts should be logged. Possible values: yes no
searcheng.usedebugse	Deprecated. If debugse is installed, controls whether all search engine interface calls/returns are logged. Possible values: yes no

Properties in futuretense.ini: Search Tab (continued)

Property	Description
verity.charset	Deprecated. Specifies the name of the locale to use for all internal Verity engine operations. This property corresponds to a subdirectory of the common directory where the locale is defined. The property is optional.
verity.debug	Deprecated. Controls whether the Verity Search Engine should put debug messages into the log file. Possible values: yes no
verity.defaultindex	Deprecated. The Verity search index to open if none is specified as an XML or Java parameter.
verity.defaultparser	Deprecated. Specifies the default parser. Possible values: • Simple • FreeText • BoolPlus
verity.indexinginterval	Deprecated. Specifies the time interval in milliseconds between each background mkvdk index process provided by Verity, Inc. As background indexing uses a large amount of memory and CPU, it is best to allow the front-end Content Server interfaces a chance to render. The bigger the interval, the faster is interface rendering, but the longer it takes for a search to be updated. Note: This property is used only when the verity.syncindexing property is set to no. Default value: 10,000
verity.knowledgebasepath	Deprecated . The path to the Verity topic that is used for queries. This property is optional.

Properties in futuretense.ini: Search Tab (continued)

Property	Description
verity.locale	Deprecated. Specifies the name of the locale to use for all internal Verity engine operations. This field corresponds to a subdirectory of the common directory where the locale is defined. This field is optional.
verity.organization	Deprecated. The organization specified in your Verity Information Server License Key. This property is case-sensitive and space-sensitive.
verity.path	Deprecated . The path to the Verity Information Server directory.
verity.signature	Deprecated. The signature text as specified in your Verity License Key. This property is case- and space- sensitive.
verity.syncindexing	Deprecated. Specifies whether the Verity search engine is to process indexes synchronously. If processing is not synchronous, the index process runs asynchronously in the background so that performance can be improved. In the current version, this property applies only to flex assets; basic assets always use synchronous indexing. Possible values: yes, no Default value: yes
verity.templatepath	Deprecated. The path of the Verity vdktemplate directory. This is a subdirectory of the FutureTense directory. For example, In Windows NT: C:\FutureTense\vdktemplate In Solaris: /export/home/FutureTense/vdktemplate

futuretense.ini: User Defined Tab

The **User Defined** tab displays custom properties, which are not created by the core Content Server product but are used by Content Server and its CS content applications.

This tab displays the following kinds of properties:

- Two custom properties for the sample site, if the Content Server portal sample site is installed.
- Properties that specify the name of the primary key column for a content table (catalog). For information about content tables, see the "Data Design" section in the *Content Server Developer's Guide*.
- Custom properties that specify resultset caching settings for individual user-defined tables in the Content Server database. For more information, see the note in "ResultSet Cache Tab" on page 88.
- Custom properties that specify resultset caching settings for revision-tracked, userdefined tables in the Content Server database. For more information, see the note in "ResultSet Cache Tab" on page 88.

The following table lists all of the properties that any of the Content Server products create in the futuretense.ini file, which means that they appear on the **User Defined** tab. Note that your system may have additional properties that are not included in this list.

Properties in futuretense.ini: User Defined Tab

Property	Description
analysisconnector.version	Deprecated.
	The version number of Analytics Bridge, if it is installed.
	Do not change the value of this property.
catalogcentre.version	Deprecated.
	The version number of CS-Direct Advantage, if it is installed. CS-Direct Advantage was named Catalog Centre in early versions of the product.
	Do not change the value of this property.
cc.AssetTypeCSz	The number of resultsets to cache against the AssetType table, an object table that is created by the Content Server installation.
	Default value: 50
cc.CategoryCSz	The number of resultsets to cache against the Category table, an object table that the Content Server installation creates for asset types.
	Default value: 50

Property	Description
cc.ComparatorsKey	The primary key of the Comparator table, a content table that the Content Server installation creates to hold field comparator classes.
	Default value: name
	Do not change the value of this property.
cc.FiltersKey	Default value: name
cc.MimeTypeKey	The primary key of the MimeType table, a content table that the Content Server installation creates to store the mimetypes of the documents that it handles.
	Default value: mimetype
	Do not change the value of this property.
cc.PreviewgenKey	Default value: name
cc.SourceKey	The primary key of the Source table, a content table that the Content Server installation creates for asset types.
	Default value: source
	Do not change the value of this property.
cc.StatusCodeCSz	The number of resultsets to cache against the StatusCode table, a content table that the Content Server installation creates for asset types.
	Default value: 10
cc.StatusCodeKey	The primary key of the StatusCode table.
	Default value: statuscode
	Do not change the value of this property.
commerceconnector.version	The version number of the Commerce Connector utility, if it is installed.
	Do not change the value of this property.
contentcentre.version	Deprecated. The version number of CS-Direct, if it is installed. CS-Direct was named Content Centre in previous versions of the product. Do not change the value of this property.

Properties in futuretense.ini: User Defined Tab (continued)

Property	Description
cs.approvalLockStriping	 Used to specify whether approval locking is global and default (false) or per target (true), which prevents targets from competing for approval and publishing activities. Setting this property to true requires you to add a non-null column named cs_target to the ApprovalQueue table. The column's data type must match the value of the cc.bigint property (in futuretense.ini). If you wish to switch back from approval locking per target to default behavior (i.e., global lock): 1. Remove the cs_target column from the ApprovalQueue table. 2. Set cs.approvalLockStriping to false
	(or remove this property, as by default it is false).
cs.parentfoldercount	Specifies the maximum number of parent folders that Content Server can generate in subdirectories of <cs_install_dir>/Shared. Parent folders are the first level of numbered folders generated by Content Server. For example, if this property is set to 500, Content Server will generate no more than 500 parent folders in <cs_install_dir>/Shared/ccurl (where flex assets are stored).</cs_install_dir></cs_install_dir>
	If you wish to use this property, you must add it to futuretense.ini. If it is not added, Content Server uses the default value. Note that when this property is used, the existing parent folder structure remains as is. Parent folders that are no longer used will need to be deleted manually.
	Within the parent folders, Content Server generates child folders. If you wish to specify the maximum number of child folders that can be generated, use the cs.childfoldercount property (page 101).
	Default value: 1024

Property	Description
cs.childfoldercount	Specifies the maximum number of child folders that Content Server can generate in parent folders under subdirectories of <cs_install_dir>/ Shared. Child folders are numbered subfolders that Content Server generates inside the parent folders. For example, if this property is set to 300, Content Server will generate no more than 300 child folders in parent folders under <cs_install_dir>/Shared/ccurl. If you wish to use this property, you must add it to futuretense.ini. If it is not added, Content Server uses the default value. Note that when this property is used, the existing child folder structure remains as is. Child folders that areno longer used will need to be deleted manually.</cs_install_dir></cs_install_dir>
	If you also need to specify the maximum number of parent folders that Content Server can generate, use the cs.parentfoldercount property (page 100).
	Default value: 1024
cs.dbencoding	Default value: UTF-8
cs.invalMemWindow	This property applies to the inCache framework. It is used to define the size of the FW_InvalidationMemory table in terms of a data storage period, in seconds, for that table. The data storage period is a rolling window.
	For example, if the property is set to 20000, 20,000 seconds worth of data can be accumulated in the table. As additional data continues to arrive, it is stored, while data older than 20,000 seconds is purged by the table's cleanup mechanism. For more information about the inCache framework and FW_InvalidationMemory table, see the Content Server Administrator's Guide.
	If you wish to use this property, add it to the futuretense.ini file and set it to your required value. If the property is not added, Content Server uses the default value.
	Default value: 259200 (i.e., 3 days)
cs.requestfactory	Default value: com.fatwire.cs.portals. portlet.PortletRequestFactory
ft.servletoutputstream	Default value: false

Description
Deprecated.
Default value: 5:0:0 */*/*
The version number of Engage, if it is installed. Engage was named Marketing Studio in previous versions of the product.
Do not change the value of this property.
Deprecated.
Default value: *:0,5,10,15,20,25,30,35,40,45,50,55 :0 */*/*
Used to enable the propagation of pages among nodes that are enabled for the inCache page caching framework. Information about inCache can be found in the <i>Content Server Developer's Guide</i> .
Used to switch between resultset caching media. When this property is set to false, Content Server caches resultsets in hash tables. When this property is set to true, Content Server caches resultsets within the inCache framework. Both caching media use the JVM memory.
When this property is set to true, the System Tools node (on the Admin tab of the Advanced interface) displays the resultset over inCache tool, which provides statistical information about the caches and their contents.
If you set this property to true, also complete the following steps:
 Ensure that the linked-cache.xml configuration file is present in the application server's classpath (WEB-INF/classes directory). Ensure that the following resultset caching properties are set (see "ResultSet Cache Tab" on page 88): cc.cacheResults cc.cacheResultsTimeout cc.cacheResultsAbs

Properties in futuretense.ini: User Defined Tab (continued)

Property	Description
rsCacheOverinCache (continued)	Note: Enabling resultset caching over inCache does not require enabling either page or asset caching over inCache. Information about the inCache framework, its caching models and system tools, and the process of enabling them is available in the <i>Content Server Administrator's Guide</i> . Additional information about resultset caching is also available in the <i>Content Server Developer's Guide</i> .
	Default value: false
	Possible values: true false
soap.binaryRowsType	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services.
	Do not change the value of this property.
soap.iList	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.likeConstraint	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.listRowsType	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.nestedConstraint	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.rangeConstraint	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.

Property	Description
soap.richTextConstraint	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.searchstate	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.standardConstraint	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.stringRowsType	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.stringVarsType	Default value: com.openmarket.basic.objects.String VarsType
soap.urlRowsType	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.
soap.URLType	A Content Server system property used to instantiate server-side objects in response to SOAP requests made by web services. Do not change the value of this property.

futuretense_xcel.ini

Properties in futuretense_xcel.ini are organized by function on the following tabs in the Property Editor:

- Analytics Tab
- Asset Default Tab
- Authorization Tab
- Debug Tab
- Directories Tab
- Element Override Tab
- Preference Tab
- Publishing Tab
- Transformer Tab
- xcelerate Tab
- User Management Tab
- User Defined Tab

Note

Content Server also inserts custom properties into the "User Defined" tab in the futuretense.ini file, as described in "futuretense.ini User Defined Tab" on page 98.

futuretense_xcel.ini: Analytics Tab

The **Analytics** tab holds properties that are used to configure FatWire Analytics 2.1. These properties are documented here in alphabetical order (they are also documented in the guide *Installing and Configuring FatWire Analytics*):

Properties in futuretense_xcel.ini: Analytics Tab

Property	Description
analytics.datacaptureurl	URL where the Analytics data capture servlet is running.
	<pre>Syntax: http://<host>:<port>/sensor/statistic</port></host></pre>
analytics.enabled	Indicates whether FatWire Analytics is installed.
	Legal values: true false
analytics.piurl	URL where the Analytics performance indicator servlet is running.
	Syntax: http:// <host>:<port>/analytics/PI</port></host>
analytics.reporturl	URL of the Analytics user interface.
	<pre>Syntax: http://<host>:<port>/analytics/ Report.do</port></host></pre>
analytics.user	Pre-configured Analytics user who logs in to FatWire Analytics from Content Server.
	Default value: csuser
	Note: Changing the default name is not recommended.

futuretense_xcel.ini: Asset Default Tab

The **Asset Default** tab holds properties that are used to define certain default details about asset types, such as cache information, default ACLs, and whether eWebEditPro is present. These properties are documented here in alphabetical order:

Properties in futuretense_xcel.ini: Asset Default Tab

Property	Description
xcelerate.asset.share ToAllAllowed	Specifies whether the assets can be shared to all sites.
	Legal values: true false
xcelerate.asset.size ofnamefield	Specifies the length of the Name field for basic and flex asset types.
	For v4.0 and later releases this value is set to 64.
	For installations that have been upgraded from releases earlier than 4.0, this value is usually set to 32.
xcelerate.body.length	Specifies the number of characters that are stored for the Body field in the Article table in the urlbody column.
	Data entered in the Body field for an article asset (a sample site asset type) is written to the urlbody column. Because this is a URL column, that data is actually stored as a file outside of the Content Server database.
	However, the first <n> number of characters, where <n> equals the value specified for this property, is also stored in the body column so that you can search for text in the body of an article asset with the search feature in the Content Server interface.</n></n>
	Default value: 1000
	Maximum values: 256 for Windows NT or Windows 2000; 2000 for UNIX.
	If this property is missing or is not set, Content Server uses the value from the cc.maxvarcharsize property in the futuretense.ini file instead.
xcelerate.defaultacl	Specifies an ACL that is automatically assigned to page entries in the SiteCatalog table when they are created by the creation of SiteEntry or Template assets.
	Default value: blank

Properties in futuretense_xcel.ini: Asset Default Tab (continued)

Property	Description
xcelerate.defaultbase	Specifies the default base of defdir for assets.
xcelerate.default cscacheinfo	Specifies the default value for the "Cache Rule (ContentServer)" field of SiteEntry and Template assets that are enabled for caching. The value is displayed when the Advanced caching option is selected; the value can be overridden.
	The "Cache Rule (ContentServer)" field maps to the cscacheinfo field in the SiteCatalog table, for each entry that corresponds to a SiteEntry asset or Template asset.
	Default value: true,~0
xcelerate.default sscacheinfo	Specifies the default value for the "Cache Rule (Satellite)" field of SiteEntry and Template assets that are enabled for caching. The value is displayed when the Advanced caching option is selected; the value can be overridden.
	The "Cache Rule (Satellite)" field maps to the sscacheinfo field in the SiteCatalog table, for each entry that corresponds to a SiteEntry asset or Template asset.
	Default value: true,~0
xcelerate.default pagecriteria	Specifies the default value for the pagecriteria column for page entries in the SiteCatalog table when they are created via a Template asset.
	Default value: c, cid, p, rendermode, site, context
	For definitions of these variables and for more information about page criteria variables in general, see the <i>Content Server Developer's Guide</i> .
xcelerate.defaultcsstatus	Specifies the default value for the csstatus column for page entries in the SiteCatalog table when they are created (for either Template or SiteEntry assets).
	Do not change the value of this property
	Default value: live

Properties in futuretense_xcel.ini: Asset Default Tab (continued)

Property	Description
xcelerate.default pagecriteriaSite Entry	Specifies the page criteria variables that can be set by default for SiteEntry assets. While you can add variables to this list, do not delete any of the default values.
	Default value: rendermode, site, seid, Sitepfx
xcelerate.ewebeditpro	Deprecated.
	If you have purchased the eWebEditPro HTML editor and your developers have designed asset types that use it, this property specifies the location of the ewebeditpro.js file.
xcelerate.MaxLinks	Specifies the number of links that could be included in a linkset, an old asset type that is no longer used.

futuretense_xcel.ini: Authorization Tab

Properties in futuretense_xcel.ini: Authorization Tab

•	
Property	Description
xcelerate.authorize functions	Contains a comma-separated list of functions for which permissions can be generated on an asset. If the value is empty, all possible functions will be displayed. Additional system-defined functions can be added to the list of default functions.
	Default value: inspect, preview, checkout, copy, edit, delete, rollback, share, approve, build
xcelerate.deny. abstainfromvot ing	Contains a comma-separated list of roles that are not allowed to abstain from voting when assigned assets as part of the workflow process.
	Default value: blank
xcelerate.deny.approve	Contains a comma-separated list of roles that are not allowed to approve assets for publishing.
	Default value: blank
xcelerate.deny.authorize	Contains a comma-separated list of roles that are not allowed to authorize privileges on assets.
	Default value: blank
xcelerate.deny.build	Contains a comma-separated list of roles that are not allowed to build Collection assets.
	Default value: blank
xcelerate.deny.checkout	Contains a comma-separated list of roles that are not allowed to checkout assets explicitly from the revision tracking system.
	Default value: blank
xcelerate.deny.copy	Contains a comma-separated list of roles that are not allowed to copy assets.
	Default value: blank
xcelerate.deny.delegate	Contains a comma-separated list of roles that are not allowed to delegate assigned assets to other participants in the workflow.
	Default value: blank

Property	Description
xcelerate.deny.delete	Contains a comma-separated list of roles that are not allowed to delete assets.
	Default value: blank
xcelerate.deny.edit	Contains a comma-separated list of roles that are not allowed to edit assets.
	Default value: blank
xcelerate.deny.inspect	Contains a comma-separated list of roles that are not allowed to inspect assets.
	Default value: blank
xcelerate.deny.placepage	Contains a comma-separated list of roles that are not allowed to place assets in the SitePlan tree.
	Default value: blank
xcelerate.deny.preview	Contains a comma-separated list of roles that are not allowed to preview assets with their templates.
	Default value: blank
xcelerate.deny.remove fromgroup	Contains a comma-separated list of roles that are not allowed to remove assets from a workflow group.
	Default value: blank
xcelerate.deny.removefrom workflow	Contains a comma-separated list of roles that are not allowed to remove assets from workflow.
	Default value: blank
xcelerate.deny.rollback	Contains a comma-separated list of roles that are not allowed to roll back assets to a previous version.
	Default value: blank
xcelerate.deny.setExport Data	Contains a comma-separated list of roles that are not allowed to set export to disk (static publishing) starting point.
	These users may still be allowed to approve and publish assets if some other users set the starting point.
	Default value: blank

Property	Description
xcelerate.deny.set nestedworkflow	Contains a comma-separated list of roles that are not allowed to set nested workflow.
	Default value: blank
xcelerate.deny.set participants	Contains a comma-separated list of roles that are not allowed to set participants for workflow. Default value: blank
xcelerate.deny.set processdeadline	Contains a comma-separated list of roles that are not allowed to set workflow process deadlines. Default value: blank
xcelerate.deny.set stepdeadline	Contains a comma-separated list of roles that are not allowed to set a deadline on a workflow step. Default value: blank
xcelerate.deny.share	Contains a comma-separated list of roles that are not allowed to share assets with other sites (other than the site the asset was originally created in). Default value: blank
xcelerate.deny.show participants	Contains a comma-separated list of roles that are not allowed to see the participants that are set for a workflow.
	Default value: blank
xcelerate.deny.showstatus	Contains a comma-separated list of roles that are not allowed to see the status screen for assets.
	The status option shows up in more drop-down box of the inspect window. The screen shows workflow, publishing, and revision tracking information about the asset that is being inspected. If the user belongs to one of the roles that is being denied the privilege, the option to view the status screen will not show. Default value: blank

Property	Description
xcelerate.deny.show version	Contains a comma-separated list of roles that are not allowed to see the list of versions for an asset. Note: User can view the list of versions for an asset that is explicitly or implicitly checked out. The inspect form will not display a Show Versions button if the user belongs to one of the roles that is denied the privilege. Default value: blank
xcelerate.grant.abstain fromvoting	Contains a comma-separated list of roles that are allowed to abstain from voting when assigned assets as part of the workflow process. Default value: blank
xcelerate.grant.approve	Contains a comma-separated list of roles that are allowed to approve assets for publishing. Default value: blank
xcelerate.grant.authorize	Contains a comma-separated list of roles that are allowed to authorize privileges on assets. Default value: SparkAdmin, GeneralAdmin, WorkflowAdmin, SiteAdmin
xcelerate.grant.build	Contains a comma-separated list of roles that are allowed to build Collection assets. Default value: blank
xcelerate.grant.checkout	Contains a comma-separated list of roles that are allowed to checkout assets explicitly from the revision tracking system. Default value: blank
xcelerate.grant.copy	Contains a comma-separated list of roles that are allowed to copy assets. Default value: blank
xcelerate.grant.delegate	Contains a comma-separated list of roles that are allowed to delegate assigned assets to other participants in the workflow. Default value: blank

Property	Description
xcelerate.grant.delete	Contains a comma-separated list of roles that are allowed to delete assets.
	Default value: blank
xcelerate.grant.edit	Contains a comma-separated list of roles that are allowed to edit assets.
	Default value: blank
xcelerate.grant.inspect	Contains a comma-separated list of roles that are allowed to inspect assets.
	Default value: blank
xcelerate.grant.placepage	Contains a comma-separated list of roles that are allowed to place assets in the SitePlan tree.
	Default value: blank
xcelerate.grant.preview	Contains a comma-separated list of roles that are not allowed to preview assets with their templates.
	Default value: blank
xcelerate.grant.remove fromgroup	Contains a comma-separated list of roles that are allowed to remove assets from a workflow group.
	Default value: blank
xcelerate.grant.remove fromworkflow	Contains a comma-separated list of roles that are allowed to remove assets from workflow.
	Default value: blank
xcelerate.grant.rollback	Contains a comma-separated list of roles that are allowed to roll back assets to a previous version.
	Default value: blank
xcelerate.grant.set ExportData	Contains a comma-separated list of roles that are allowed to set export to disk (static publishing) starting point.
	Default value: blank
xcelerate.grant.set nestedworkflow	Contains a comma-separated list of roles that are allowed to set nested workflow.
	Default value: blank

Property	Description
xcelerate.grant.set participants	Contains a comma-separated list of roles that are allowed to set participants for workflow. Default value: blank
xcelerate.grant.set processdeadline	Contains a comma-separated list of roles that are allowed to set workflow process deadlines.
	Default value: blank
xcelerate.grant.set stepdeadline	Contains a comma-separated list of roles that are not allowed to set a deadline on a workflow step.
	Default value: blank
xcelerate.grant.share	Contains a comma-separated list of roles that are allowed to share assets with other sites (other than the site the asset was originally created in).
	Default value: blank
xcelerate.grant.show participants	Contains a comma-separated list of roles that are allowed to see the participants that are set for a workflow.
	Default value: blank
xcelerate.grant.show status	Contains a comma-separated list of roles that are allowed to see the status screen for assets.
	The status option shows up in the more drop-down box of the inspect window. The screen shows workflow, publishing, and revision tracking information about the asset that is being inspected. If the user belongs to one of the roles that is being granted the privilege, the option to view the status screen will show.
	Default value: blank
xcelerate.grant.show version	Contains a comma-separated list of roles that are allowed to see the list of versions for an asset.
	Note: The user can view the list of versions for an asset that is explicitly or implicitly checked out. The inspect form will display a Show Versions button if the user belongs to one of the roles that is granted the privilege.
	Default value: blank

futuretense_xcel.ini: Debug Tab

The **Debug** tab holds properties that enablethe various Content Server debugging utilities. These properties are documented here in alphabetical order.

Properties in futuretense_xcel.ini: Debug Tab

Property	Description
am.debug	Specifies whether AssetMaker logs debugging information about the asset types it makes. When this property is set to on, information about the creation of asset types is written to the futuretense.txt file.
	Default value: off
asset.debug	Specifies whether Desktop and the Export Assets to XML publishing method log debugging information when they manipulate assets. When this property is set to on, information about the manipulation of assets is written to the futuretense.txt file.
	Default value: off

futuretense_xcel.ini: Directories Tab

The **Directories** tab holds properties that enable the various Content Server directories, such as utilities. These properties are documented here in alphabetical order.

Properties in futuretense_xcel.ini: Directories Tab

Property	Description
xcelerate.local languagedir	Specifies the directory path of the CS-Desktop client installation.
	This value is set by the Content Server installation.
	Default value: C:/FutureTense/ futuretense_cs/xcelerate/Client/ ClientInstall/CSDesktop
xcelerate.lockdir	Specifies the directory path (including the final slash) to the directory where Content Server stores information about the locks that lock data during database operations. If this CS system is installed on a cluster, this directory must have write permissions for and be accessible to all cluster members.
	This value is set by the Content Server installation.
	Default value: c:/FutureTense/lock/
xcelerate.objpubdir	Specifies the path to a directory in cluster-shared file space (including the terminating slash character) in which objects that get published are stored temporarily.
	This value is set by the Content Server installation.
	Default value: C:/FutureTense/objpubdir/
xcelerate.pubkeydir	Specifies the directory where the publishing system writes information about the items that have been published to the various target systems.
	This value is set by the Content Server installation.
	Default value: c:/FutureTense/pubkeys/
xcelerate.saveSearchdir	Specifies the defdir (default storage directory) for the SaveSearch table. This table has a URL column that holds the saved searches on a development or management system.
	This value is set by the Content Server installation.
	Default value: c:/FutureTense/Storage/ SaveSearch

Properties in futuretense_xcel.ini: Directories Tab (continued)

Property	Description
xcelerate.sePath	Specifies the directory where search indexes are stored when you are using a search engine on your CS system.
	If you change this value, be sure to specify a directory that exists. (This property does not create the directory for you.)
	Legal values:
	• Windows NT or Windows 2000:
	c:/FutureTense/sedb
	• Solaris or AIX: /export/home/FutureTense/sedb
xcelerate.tempobjectsdir	Specifies the defdir (default storage directory) for the TempObjects table, a Content Server table that stores information about objects that are uploaded or in the process of being created until they are either saved or canceled.
	This value is set by the Content Server installation.
	<pre>Default value: c:/FutureTense/ tempobjectsdir/</pre>
xcelerate.thumbnaildir	Specifies the directory where the template asset will store thumbnail images associated with template variant thumbnails.
	This value is set by the Content Server installation.
	Default value: C:/FutureTense/ thumbnaildir/
xcelerate.workflowdir	Specifies the name of the directory that holds files related to workflow processes.
	This value is set by the Content Server installation.
	Default value: C:/FutureTense/workflowdir
	If you change the value from the default, be sure that directory exists.

futuretense_xcel.ini: Element Override Tab

The **Element Override** tab holds properties that you can use to help customize the user interface. These properties are documented here in alphabetical order:

Properties in futuretense_xcel.ini: Element Override Tab

Property	Description
xcelelem.manageuserpub	Defines the element that Content Server uses to manage the roles that users fulfill for your Content Server sites.
	Default value: Openmarket/Xcelerate/Actions/ Security/AccessUserPublication
xcelelem.publishfactors	The name of the element used to provide additional publishing control factors. May be empty.
	Default value: Openmarket/Xcelerate/Actions/ Publish/OverrideFactor
xcelelem.publishoptions	This property allows customization of a portion of the common options area of the publishing form.
	It is used by the Action/Publish/PublishOptions element.
	If this is defined, it names an element to call which will lay out the publishing options section of all the publishing forms.
	Default value: empty
xcelelem.setpubid	Deprecated.
	Specifies the name of the element that sets the pubid session variable when visitors first come to your site via a dynamic URL. It is run once per visitor session.
	Default value: OpenMarket/Xcelerate/ Actions/Publish/SetPubid

futuretense_xcel.ini: Preference Tab

The **Preference** tab holds properties that you use to configure the search feature, the tree, and the character set used on your system.

These properties are documented here in alphabetical order.

Properties in futuretense_xcel.ini: Preference Tab

Property	Description
xcelerate.charset	Specifies the character set that Content Server uses to communicate with the server.
	Default value: UTF-8
	Changing this property from the default value may limit the characters that are supported.
xcelerate.email	Deprecated.
notification	Specifies whether the Content Server workflow e-mail notification feature is enabled.
	When this property is set to true, the workflow system sends e-mail messages to users when assets are assigned to them through a workflow process.
	Default value: false
	See also, the "Email" section in the Content Server Administrator's Guide.
xcelerate.restrict SiteTree	Specifies whether users other than admin users can toggle the tree on in the Content Server interface when it is configured to be toggled off by default (that is, the xcelerate.showSiteTree property is set to false).
	Set to true to enable only users with the xceladmin ACL to be able to toggle the tree back on.
	Default value: false
	For more information about this feature, see the Content Server Administrator's Guide.
xcelerate.seLimit	Specifies the maximum number of query results that should be returned from any internally conducted search engine query. Default value: 10000

Property	Description
xcelerate.showSiteTree	Specifies whether the tree is displayed by default when any user logs in to the Content Server interface.
	Set to false if you want the tree to be toggled off by default.
	Default value: true
	For more information about this feature, see the <i>Content Server Administrator's Guide</i> .
xcelerate.treehierasset type	Enables hierarchical display mode for SiteEntry, CSElement, Template, and Recommendation assets.
	The value of this property is a comma-delimited list of asset types that should be displayed in a hierarchy.
	Asset types whose assets should not be displayed in a hierarchy should not be included in the list.
	The hierarchical structure is based on the "/" the in the asset name. Each "/" in the asset name represents one hierarchy level, e.g. "/ AssetName" is the top level, "//AssetName" is the next level, and so on.
	Default value: SiteEntry, CSElement, Template, Recommendation
xcelerate.treeMaxNodes	Specifies the number of items that are displayed under a node in the tree in the Content Server interface. When a node has more than this number of items, Content Server prompts the user to enter search criteria to reduce the number.
	Default value: 100
	For more information about this feature, see the Content Server Administrator's Guide.
xcelerate.treeType	Specifies the kind of tree that is used in the Content Server interface.
	Legal values: OMTree or a value that specifies a customized replacement tree
	Default value: OMTree
	Do not change this property without first consulting FatWire Professional Services or FatWire Customer Support.

Property	Description
xcelerate.usese	Specifies whether Content Server should use an installed search engine.
	Legal values: true false
	Default value: false

futuretense_xcel.ini: Publishing Tab

The **Publishing** tab holds the properties that provide information to the Content Server publishing system, which also uses the properties in the futuretense.ini file (Export/Mirror tab). For descriptions of the properties, see "Export/Mirror Tab" on page 76.

Properties in futuretense_xcel.ini: Publishing Tab

Property	Description	
xcelerate.batchhost	Specifies the host name and port number of the server on which the publish process will run.	
	Only one batch host is supported in a clustered Content Server environment. This property must be set on each cluster member to point to the same dedicated host.	
	Legal value: <hostname>:<portnumber></portnumber></hostname>	
xcelerate.batchmode	Defines the batch publishing mode.	
	Legal values:	
	 single—batch host is a dedicated IP address. multiple—batch host is a cluster IP address. 	
	Default value: single	
xcelerate.batchload sizeonpublish	Controls the batch size of assets loaded during a publishing event.	
	Default value: 250	
xcelerate.batchpass	Specifies the password for the batch user.	
	Default value: xceladmin	
	Be sure to change this value after you create the batch user for this CS system. For information, see the <i>Content Server Administrator's Guide</i> .	
xcelerate.batchsave sizeonpublish	Controls the batch size of assets saved during a publishing event.	
	Default value: 250	
xcelerate.batchuser	The Content Server publishing system runs as a background process and you must configure a batch user account for the publishing system to use. This property specifies the user name of the batch user.	
	Default value: admin	
	Be sure to change this value after you create the batch user for this CS system. For information, see the <i>Content Server Administrator's Guide</i> .	

Property	Description
xcelerate.blobref	The name of the class that manages the publish references for blobs. The default is provided here for reference only: com.openmarket.xcelerate.publish.Blob Ref. De not change the value of this property.
	Do not change the value of this property. For information about published references, see
	the Content Server Administrator's Guide.
xcelerate.bulkapprove chunk	Specifies the number of assets to approve at the same time, in the same batch or "chunk," when someone uses the Approve Multiple Assets feature in the Content Server interface.
	The feature approves all the assets that are selected for approval in batches and the number of assets in each batch is set by this property.
	Default value: 500
	For information about the Approve Multiple Assets feature, see the Content Server Administrator's Guide.
xcelerate.donotregenerate	Specifies whether cached pages are regenerated after a publishing session.
	Legal values:
	• blank, that is, no value—means that all the pages in the cache that were affected by the publish session are refreshed.
	• unknowndeps—means that cached pages that were generated from an element that used a RENDER. UNKNOWNDEPS tag are not refreshed.
	• * (asterisk)—means none of the pages in the cache are refreshed. In other words, the affected pages are refreshed only when a visitor requests the page.
	Default value: blank
	Do not change the value of this property without first consulting FatWire support personnel.
xcelerate.exportmax filename	This is the maximum length of any file name generated during export publishing.
	If you are running Windows NTFS, you may want to set this to a low value to make it possible to reexport, delete or rename files created by the export-to-disk publish process. NTFS has an upper limit of 255 characters for any path name.

Property	Description
xcelerate.mirrorini	If you have had the element identified by the xcelerate.remotecall property modified in such a way that it needs information from additional property files other than futuretense.ini, this property specifies the names of all the property files that are needed.
	Default value: futuretense.ini
	Do not modify this value to include additional property files without consulting FatWire Professional Services or FatWire Customer Support.
xcelerate.pageref	Specifies the name of the class that manages publish references for pages. The default is provided here for reference only:
	com.openmarket.xcelerate.publish.Page Ref.
	Do not change the value of this property.
xcelerate.presaveelt	Specifies the name of the element called on the mirror target during publish after the assets' primary rows have been mirrored, but prior to the deserialization and asset.save of the flex and complex assets. Use PresaveElement for standard mirror publish.
xcelerate.pubabortelt	Specifies the name of the element called on the mirror target if the publish fails.
	Default value: PubAbortElement for standard mirror publish.
xcelerate.pubcleanupelt	Specifies the name of the element that the publishing system uses during the cleanup phase of a mirror publish operation.
	Default value: PubCleanupElement
	Do not modify this value without consulting FatWire Professional Services or FatWire Customer Support.

Property	Description
xcelerate.publishall assettypes	Specifies whether to publish all asset types on mirror publish.
	Legal values: true false
	If set to true all asset types will be published.
	If not set to true, only asset types of the assets involved in the publish and their dependent asset types will be published.
	Note: If you want to setthis property to true, you have to make sure that all asset types that exist on the source server also exist on the publish destination.
xcelerate.publish invalidate	Specifies whether an asset is marked as changed on the destination system when an asset is published. If it is marked as changed, it must be approved on that system before it can be published from that system to a new destination.
	Legal values: true false
	Default value: true
	Because having the publishing system take the time to mark the assets as changed on the destination adds time to the publishing session, typically you leave this property set to true on development and management systems but change it to false on delivery systems.
xcelerate.pubsetupelt	Specifies the name of the element that the publishing system uses during the setup phase of a mirror publish.
	Default value: PubSetupElement
	Do not modify this value without consulting fatwire Professional Services or fatwire Customer Support.
xcelerate.remotecall	Specifies the pagename that is invoked on the target system during a mirror publishing session.
	Default value:
	Openmarket/Xcelerate/PrologActions/ Publish/Mirror1/RemoteCall
	Do not modify this element or change the value of this property without assistance from FatWire Professional Services or FatWire Customer Support.

Property	Description
xcelerate.templatedefault	The name of the template to use if a template cannot be found to render an asset type.
	Default value: Openmarket/ TemplateDefault

futuretense_xcel.ini: Transformer Tab

The **Transformer** tab holds the properties that apply to content created in CS-Desktop, where both text and a single image are saved to the same blob attribute, and format is preserved (i.e., both the text and the image are preserved when converted to an asset). The *Content Server Administrator's Guide* covers the remaining scenarios, such as a blob attribute holding data of a single type, for which setting a property is not required.

Properties in futuretense_xcel.ini: Transformer Tab

Property	Description
transformer.imgdir	Specifies the path to the image files that CS-Desktop will use when transforming a Word document into an asset. This property applies only to assets created in CS-Desktop, where both text and a single image are saved to the same blob attribute, and format is preserved.
	Note: This property is not set by the installer. Leaving it blank will cause CS-Desktop to ignore the <transformer.imgdir> directory and therefore omit image files from the assets it creates from Word documents.</transformer.imgdir>
	When a blob attribute in a given asset type is enabled for CS-Desktop and it supports data of mixed types, users can save text and a single image to the blob attribute when they create or edit the Word document. When the Word document is saved, its content is transformed into an asset. During transformation, the image file is written to the <transformer.imgdir> directory, while the text is stored as HTML in the URL column in Content Server's database. The HTML file has an unmanaged link to the image in the <transformer.imgdir> directory. (The asset is accessible from Content Server's interface; the Word document remains intact and available for editing through CS-Desktop.) Blob fields containing data of mixed types require you to implement a process that regularly mirrors the <transformer.imgdir> directory to the delivery system, because the publishing system does not mirror this directory.</transformer.imgdir></transformer.imgdir></transformer.imgdir>
	To set the <transformer.imgdir> path</transformer.imgdir>
	1. Define a webroot somewhere that points to a directory in a shared file system which is accessible from all cluster members.
	2. Set transformer.imgurl to be either the relative URL path (starting with /) of the webroot you defined, or the absolute URL (starting with http) of the webroot.
	3. Set transformer.imgdir to the directory path that the webroot points to.
	For more information about the storage of content created (or edited) in CS-Desktop, see "CS-Desktop" in the <i>Content Server Administrator's Guide</i> .

Properties in futuretense_xcel.ini: Transformer Tab (continued)

Property	Description
transformer.imgurl	This property specifies either the relative URL path or the absolute path of the webroot that CS-Desktop will use to store the image files it extracts from Word documents when converting the Word documents to assets. (The Word documents remain intact.)
	Note: This property is used with the transformer.imgdir property and applies only to assets created in CS-Desktop, where both text and a single image are saved to the same blob attribute, and the format is preserved.
	This property is not set by the installer. Leaving it blank will cause CS-Desktop to ignore the directory containing the image files (<transformer.imgdir>) and therefore omit image files from the assets it creates from Word documents.</transformer.imgdir>
	For more information about the usage of this property, see transformer.imgdir.

futuretense_xcel.ini: xcelerate Tab

The **xcelerate** tab holds the properties that specify such things as default administrative settings, whether the InSite Editor is enabled, whether workflow configuration and search engine are being used, and whether LDAP is being used. These properties are documented here in alphabetical order:

Properties in futuretense_xcel.ini: xcelerate Tab

Property	Description
cs.binarypath	Set at installation time. This property points to the location where Content Server and third party binaries (shared objects) are stored.
	Note: Do not change the value of this property.
wem.enabled	This is a system property. Its value must not be changed except by the silent or GUI installer.
	This property is set to true if WEM is installed. If WEM is not installed, then this property is set to false.
xcelerate.adminacl	Specifies the ACL that users must be assigned so they can access administrator functions (that is, any of the functions that appear on the Admin tab in the Content Server interface).
	Default value: xceladmin
	If you change the value of this property to a different ACL, be sure to assign that ACL to all the tables that currently have the xceladmin ACL assigned to them.
xcelerate.adminrole	Specifies an ACL that is set for all administrative tables during installation.
	Default value: xceladmin
	Do not change the value of this property after your system is installed.
xcelerate.approval.depend ency.chunksize	This property defines the chunk size used in approval. (Chunk size is the number of assets that are processed by Content Server at a given time during approval to publish. Processing involves calculating dependencies.)
	Default value: 250 (for backward compatibility)
	Legal values: any integer between 1 and 1000
	Recommended value: 1

Property	Description
xcelerate.base	Specifies the top-level (base) directory of the Content Server elements. During installation, the installer might need to edit this value to indicate where the Content Server elements are in your installation.
	Default value:
	 Windows NT or Windows 2000: c:/Fatwire/elements/OpenMarket/ Xcelerate Solaris or AIX: /export/home/Fatwire/elements/ OpenMarket/Xcelerate
	Do not change the value of this property after your system is installed.
xcelerate.crosssiteassign	Specifies whether users from more than one site can participate in the same workflow process.
	Legal values: true false
	Default value: false
xcelerate.defaultlang	Specifies the default language.
	Default value: en_US
xcelerate.defaultpreview urlgenerator	Set to the preview generator name to generate URLs for preview, if no site-specific one is described.
xcelerate.domain	Specifies the domain name of the system, not including the server (machine) name. This property is used by applications that have been integrated with Content Server and that have a browser interface.
xcelerate.editrole	Specifies an ACL that is set for editorial tables during installation.
	Default value: xceleditor
	Do not change the value of this property after your system is installed.
xcelerate.enableinsite	Enables or disables the InSite Editor for this CS system. A value of true enables the InSite Editor.
	Default value: false
	Do not enable the InSite Editor on your Content Server delivery system.
xcelerate.imageurl	Specifies the webroot for all image URLs used by the applications.

Property	Description
xcelerate.previewhost	One of two properties that enable the preview host feature, this property defines the protocol, server, and port for the preview host to use.
	For information about this feature, see "Maintaining Separate Browser Sessions for Preview" in the <i>Content Server Administrator's Guide</i> .
	If you provide a value for this property, use the following syntax:
	http:// <servername>:<port></port></servername>
xcelerate.previewservlet	One of two properties that enable the preview host feature, this property specifies which servlet the preview host should use.
	For information about this feature, see "Maintaining Separate Browser Sessions for Preview" in the <i>Content Server Administrator's Guide</i> .
	Legal values: ContentServer or Satellite
	Default value: Satellite
xcelerate.previewurlpage name	Set to the name of page to generate URLs for preview.
	Do not change the value of this property.
xcelerate.publishquery style	Defines the query style to use when getting a list of assets approved for publishing.
	Legal values: subquery, join
xcelerate.rolemanager class	Specifies the name of the role manager class. By default, the value of this property is set to the Content Server role management system.
	Default value: com.openmarket.xcelerate. roles.RoleManager
	• If you are using a Sun ONE embedded Identity Server, set this property to the following value, exactly: com.openmarket.xcelerate.roles.Iden tityServerRoleManager
	• If you are using a WebLogic embedded LDAP, set this property to the following value, exactly: com.openmarket.xcelerate.roles.Flat LDAPRoleManager

Property	Description
xcelerate.searchResult Cols	Specifies which columns are displayed in the search results list in the Advanced interface. (Custom columns cannot be added.)
	<pre>Default value: name, description, modified, locale, startDate, endDate, as setType</pre>
	Note: The column order specified in this property does not affect the actual column order in the search results list. The order is Name, Description, Type (here, Type denotes "asset definition"), Locale, Status, Modified, Start Date, End Date. Attribute names are casesensitive.
xcelerate.systemid	Specifies the identifier for this Content Server system. It is used for generating unique identifiers for exported data.
	Select a value that is different from the IDs of all other known Content Server systems. Otherwise, ID conflicts will arise.
	Default value: CSSystem
	Legal values: any alphanumeric string of 1–255 characters
xcelerate.transformpath	Set at installation time. This property sets the path to the directory where CS-Desktop temporarily stores the Microsoft Word files that Content Server will transform into assets.
	Note: Do not change the value of this property.
xcelerate.treetabmanager class	The class that implements ITreeTabManager to provide tree tab descriptions for Content Server.
	Default value: com.openmarket.xcelerate. treetab.TreeTabManager
	The default is provided here for reference only. Do not change the value of this property.

Property	Description
xcelerate.usermanager class	The class that implements IUserManager to provide user services for Content Server.
	Default value: com.openmarket.xcelerate.user. UserManager
	• If you want to implement LDAP attribute- mapping for site and role names, set this property to the following value, exactly: com.openmarket.xcelerate.user. LDAPSchemaUserManager
	• If you are using a WebLogic or Sun ONE Application Server embedded LDAP, set this property to the following value, exactly: com.openmarket.xcelerate.user. FlatLDAPSchemaUserManager
xcelerate.workflowengine class	The class that implements IWorkflowEngine to provide workflow services for Content Server. The default is provided here for reference only:
	com.openmarket.xcelerate.workflow. WorkflowEngine
	Do not change the value of this property.

futuretense_xcel.ini: User Management Tab

The **User Management** tab holds the properties that specify various user attribute names, which hold different information about the user, such as the list of roles that the user has for a publication, the screen name that the user uses, and the list of sites for which the user is enabled.

Properties in futuretense_xcel.ini: User Management Tab

·	
Property	Description
xcelerate.displayable nameattr	Specifies the name of the user attribute describing the displayable name, if different from the login name.
xcelerate.emailattr	Specifies the name of the user attribute that is used to identify a user's e-mail address to your CS system. These attributes are kept in the SystemUserAttr table. Default value: mail
xcelerate.localeattr	Specifies the name of the user attribute that identifies the locale that a user specifies if you have more than one language pack installed on your CS system.
	Default value:
	Blank when one language is present.
	• locale when more than one language is present.
xcelerate.pubrolesattr	Specifies the name of the user attribute that lists the roles that the user has for publication.
	This property is only used if xcelerate.usermanagerclass is set to com.openmarket.xcelerate.user. LDAPAttrUserManager
	This is combined with the publication id to obtain the attribute name containing the roles the user has for the publication.
	If value is not set, the UserPublication table is used, or some other LDAP User Manager Plug-in is used.

Properties in futuretense_xcel.ini: User Management Tab (continued)

Property	Description
xcelerate.sitenameattr	Specifies the naming attribute of the site entries. This property is only used if xcelerate.usermanagerclass is set to com.openmarket.xcelerate.user.LDAPSch emaUserManager. By default, this value is blank, which means that information about a user's roles is stored in the UserPublication table, or some other LDAP User Manager plug-in is used. If there is a value specified for this property, the
xcelerate.sitesattr	xcelerate.usermanagerclass, and xcelerate.sitesroot properties must also be configured correctly.
xcelerate.SiteSattr	Specifies the name of the user attribute describing which publications the user has roles for. This property is used only if xcelerate.usermanagerclass is set to com.openmarket.xcelerate.user.LDAPAtt rUserManager. If there is a value for this property, it is combined with the value of the pubid column and the value for the xclerate.pubroleattr property to determine a user's access rights in the Content Server interface.
	By default, this value is blank, which means that information about a user's roles is stored in the UserPublication table, or some other LDAP User Manager plug-in is used.
xcelerate.sitesroot	Specifies the root node (dn) under which sites are located. This property is used only if xcelerate.usermanagerclass is set to com.openmarket.xcelerate.user.LDAPSchemaUserManager. By default, this value is blank, which means that information about a user's roles is stored in the UserPublication table, or some other LDAP User Manager plug-in is used. If there is a value specified for this property, the xcelerate.usermanagerclass and xcelerate.sitenameattr properties must also be configured correctly.

Properties in futuretense_xcel.ini: User Management Tab (continued)

Property	Description
xcelerate.userimageattr	This property points to the imagesrc attribute in the WEM user's account (accessible from the WEM Admin interface). The attribute contains image data in a base 64 encoded string. This property fetches the image.

futuretense_xcel.ini: User Defined Tab

Properties in futuretense_xcel.ini: User Defined Tab

Property	Description
xcelerate.fckeditor. basepath	FCKEditor basepath; that is, the location of the FCKEditor files on this Content Server system.
	Default value: / <uri>/FCKeditor/</uri>
fckeditor.showIncluded ElementInSpan	Controls how FCKEditor behaves when you include assets within text.
	When you include assets that use <div> tags, FCKEditor does not change them to tags.</div>
	If you want FCKEditor to change <div> tags to tags (as happened in Content Server releases prior to version 7.6), add this property and set it to true.</div>
xcelerate.imageeditor. basepath	Online Image Editor (OIE) basepath; that is, the OIE archive location (relative URL), file name, and version.
	<pre>Default value: <uri>/ImageEditor/ OIE.cab#version=3,0,1,10</uri></pre>
xcelerate.imageeditor. clarkii4.basepath	Path to the Clarkii Online Image Editor files on this Content Server system.
	<pre>Default value: <application_context_ root="">/ImageEditor/clarkii4/</application_context_></pre>
xcelerate.useDimension Assets	This property is supported only on delivery systems. This property controls whether a Content Server delivery system queries the Dim and DimP database tables for Dimension assets.
	If you do not use Dimension assts (i.e., for multilingual support), do the following to prevent your delivery system from unnecessarily querying the Dim and DimP tables:
	1. Add this property to futuretense_xcel.ini and set it to false.
	2. Set -Dcs.disable.dimensions.in.ui for the JVM to true in the application server startup script.

gator.ini

Properties in gator.ini are organized by function on the following tabs in the Property Editor:

- Gator Tab
- User Defined Tab

gator.ini: Gator Tab

Properties in gator.ini: Gator Tab

Property	Description
cc.attrDisplayStyle	The field to display (name or description) to describe attributes on a FlexAsset or FlexGroup ContentForm or ContentDetails screen.
	Possible values: name or description
	Default value: name
cc.attributeinheritance	A boolean that Gator uses to determine whether attributes should be inherited from parent to child. Default value: true
cc.extrapath	A boolean that Gator uses to determine if blobs should have extra path information prepended to avoid directory capacity issues on Unix.
	Default value: true
cc.fullconstraint	A boolean that Gator uses to determine if nested queries should include data from the outer query.
	Possible values: true false
	Default value: true
cc.money	The sql for defining a field that will contain monetary values. Choose the default or contact your database administrator.
	Default value: NUMERIC(20,3)
	Do not change this value without consulting your database administrator.

Properties in gator.ini: Gator Tab (continued)

Property	Description
cc.querystyle	A boolean that Gator uses to determine which basic form of assetset query to generate.
	Possible values: subquery, join, or intersect
	Default value: subquery
	Note that setting the value of this property to intersect functions only if your database can support intersection queries.
cc.string	The sql for defining a field that will contain string values.
	Default value: SEARCHVARCHAR
	Do not change this value without consulting your database administrator.
cc.textdistinct	A boolean describing whether your database can support DISTINCT on attributes of type TEXT.
	Default value: no
cc.url	The sql for defining a field that will contain URLs.
	Default value: VARCHAR(128)
	Do not change this value without consulting your database administrator.
cc.urlattrpath	Specifies the default base path Gator uses for URL attribute files.
	Default value: c:/futuretense/ futuretense_cs/urlfiles
cc.useLegacyInputNames	Specifies the boolean that Gator uses to determine the input names of attributes on FlexAsset/Parent forms. Turn this property on if you need to support custom attribute editors that have not been updated to the new format.
	Default value: false
mwb.assetsetclass	Specifies the name of the class that supplies the services for assetset management.
	Default value: com.openmarket.gator. assetset.AssetSet
	Do not change the value of this property. The default is provided here for reference only.

Properties in gator.ini: Gator Tab (continued)

Property	Description
mwb.cartclass	The name of the class that supplies the services for cart management.
	Default value:
	com.openmarket.catalog.cart.Cart
	Do not change the value of this property. The default is provided here for reference only.
mwb.cartsetclass	Specifies the name of the class that supplies the services for cart set management.
	Default value: com.openmarket.catalog. cartset.CartSet
	Do not change the value of this property. The default is provided here for reference only.
mwb.commercecontextclass	Specifies the name of the class that supplies the services for commerce context.
	Default value: com.openmarket.gator.comm ercecontext.CommerceContext
	Do not change the value of this property. The default is provided here for reference only.
mwb.commerceengineclass	Specifies the name of the class that supplies the services for commerce engine management.
	Default value: com.openmarket. cscommerce.txcart.TransactEngine
mwb.commerceuserclass	Specifies the name of the class that supplies the services for commerce user management.
	Default value: com.openmarket.catalog. cart.CommerceUser
mwb.conservativedependen	Specifies the types of dependencies between:
cies	• flex assets and flex attributes
	• flex assets and flex definitions If you want dependencies to be exact between
	flex assets and flex attributes, and between flex
	assets and flex definitions, then set this property to true. For information about exact and exists
	dependencies, see the Content Server Administrator's Guide.
	Default value: false

Properties in gator.ini: Gator Tab (continued)

Property	Description
mwb.defaultattributes	Specifies the default attribute asset name for Gator to use when creating assetsets.
	Default value: blank
mwb.externalattributes	Specifies a boolean that Gator uses to determine if forms should allow users to define external attributes.
	Default value: true
mwb.path	Specifies the directory where Gator is installed. Be sure to end the directory with a forward slash (/).
	Default value: c:/nas21/apps/
	Do not change the value of this property.
mwb.promotioncutoff	Specifies the confidence rating that determines whether a visitor qualifies for a promotion.
	Possible values: integers between 0 and 100, inclusive
	Default value: 50
	Do not change the value of this property.
mwb.searchdir	Specifies the directory where Gator places richtext indexes. Be sure to end the directory with a forward slash (/).
	Default value: c:/futuretense/gator/search/
	Do not change the value of this property.
mwb.searchstateclass	Specifies the name of the class that supplies the services for search state management.
	Default value: com.openmarket.gator. searchstate.SearchState
	Do not change the value of this property. The default is provided here for reference only.

Properties in gator.ini: Gator Tab (continued)

Property	Description
mwb.segmentcutoff	The confidence rating that determines whether to include a visitor in a segment.
	Possible values: integers between 0 and 100, inclusive.
	Default value: 50
	Do not change the value of this property.

gator.ini: User Defined Tab

Properties in gator.ini: User Defined Tab

Property	Description
Note: This ta	b, by default, has no properties.

jsprefresh.ini (Deprecated)

Note

The jsprefresh.ini file has been deprecated as it applies to installations running on WebLogic versions 8.1 and lower.

The <code>jsprefresh.ini</code> file holds properties which provide information that Content Server needs in order to serve JSP files correctly when running on the WebLogic application server. Additional properties for serving JSP files are configured in the <code>JSP</code> tab in <code>futuretense.ini</code>. For more information about the properties, see "<code>JSP Tab</code>" on page 78.

Properties in jsprefresh.ini (WebLogic Only)

Property	Description
app	Deprecated.
	Specifies the name of the application that was created in WebLogic to refer to Content Server.
	This value is set during installation. It should match the value set for the component property.
component	Deprecated.
	Specifies the name of the application that was created in WebLogic to refer to Content Server.
	This value is set during installation. It should match the value set for the app property.
domain	Deprecated.
	Specifies the domain in which WebLogic is configured.
	This value is set during installation.
password	Deprecated.
	Specifies the password for the user account for the WebLogic Admin Server. This value is encrypted.
	This value is set during installation.
url	Deprecated.
	Specifies the URL at which you access WebLogic.
	This value is set during the installation of a CS system and it follows this format:
	http://servername:port

Properties in jsprefresh.ini (WebLogic Only) (continued)

Property	Description
user	Deprecated. Specifies the user name of the user account for the WebLogic Admin Server. This value is set during installation.
version	Deprecated.
	Specifies the version number of the WebLogic server.
	If you are using WebLogic 6.1, set it to 6.
	If you are using WebLogic 7.x, set it to 7.

log4j.properties

Apache log4j can be set up as Content Server's logging system either during the installation process or manually after installation. For detailed information, see the *Content Server Rollup Installation Guide* and the *Content Server Administrator's Guide*.

When log4j is set up, the log4j.properties file is created to specify how information must be logged and which information will be logged. The log4j.properties file contains the following entries:

- A set of appenders named FWDefaultAppender, which specify how information
 must be logged. For example, the FWDefaultAppender.File property specifies
 Content Server's log file and its location. For the list of properties, see "Configure
 log4j" in the Content Server Administrator's Guide. For descriptions of these and
 other log4j-specific properties, see the Apache log4j documentation.
- Content Server loggers, which specify the type of information that will be logged and at which severity level. For example, com.fatwire.logging.cs.db is used to specify the log severity for database access messages. Messages written to this logger relate to database access, queries, and statement execution.

When log4j is set up, Content Server loggers are copied from the commons-logging.properties file to the log4j.properties file and log4j.logger is prepended to each logger name. For example, com.fatwire.logging.cs.db in commons-logging.properties becomes log4j.logger.com.fatwire.logging.cs.db in log4j.properties. For descriptions of Content Server loggers, see commons-logging.properties on page 22.

If log4j is set up, the Content Server Advanced interface provides the **Configure log4j** tool in the **System Tools** node, on the **Admin** tab. The **Configure log4j** tool enables general administrators to view current loggers, temporarily change logger levels, and add new loggers directly from the Advanced interface. Changes made from the Advanced interface remain in effect only until Content Server is restarted. They will persist upon restart only if the text version of the logger properties is copied from the interface to the log4j.properties file. (Changes that are made directly in the log4j.properties file will not be applied to Content Server until the system is restarted.) For more information about the **Configure log4j** tool, see the *Content Server Administrator's Guide*.

logging.ini (Deprecated)

The logging.ini file holds properties that configure the Logging module. The Logging module writes messages to the futuretense.txt file.

Note

The Logging module is deprecated. It is used only by the Directory Services API.

Properties in the logging.ini file are organized by function on the following tabs in the Property Editor:

- Global Data Tab
- Message Resources Tab
- User Defined Tab

logging.ini: Global Data Tab

The Global Data tab holds one property:

Properties in logging.ini: Global Data Tab

Property	Description
log.filterLevel	Deprecated.
	The severity threshold that determines the amount of messages that the Logging module writes to the log.
	Possible values:
	• info: writes all informational, warning, error, severe, and fatal messages.
	 warning: excludes informational messages; writes warning, error, severe, and fatal messages.
	 error: excludes warning and informational messages; writes error, severe, and fatal messages.
	• severe: excludes error, warning, and informational messages; writes severe and fatal messages.
	• fatal: writes fatal messages only.

logging.ini: Message Resources Tab

The Message Resources tab holds properties that provide logical mappings for the message bundles that are located, delivered, and reported by the Logging Module when the module is invoked by various components of the applications.

Caution

Do **not** change the values of any properties on this tab.

Properties in logging.ini: Message Resources Tab

Property	Description
log.Directory.messages	Deprecated.
	Java resource bundle to use for the Directory Services API.
	Default value: com.openmarket. directory.DirectoryResources.
	Do not change the value of this property.
log.Logger.messages	Deprecated.
	Java resource bundle to use for the Logging module.
	Default value: com.openmarket.logging. LoggerMessageResources
	Do not change the value of this property
log.transformer.messages	Deprecated.
	Class that provides message resources for the Default Transformer WebMethodsEnterprise Connector Subsystem.
log.wmentconnector.messages	Deprecated.
	Class that provides message resources for the WebMethodsEnterprise Connector System.

logging.ini: User Defined Tab

Properties in logging.ini: User Defined Tab

Property		Description
	Note: This tab, t	by default, holds no properties.

omii.ini

omii.ini

The omii.ini file is a system-specific file. It is created during the installation of Content Server to record the installation conditions and options that are chosen for Content Server.

Caution

The omii.ini file is used by the Content Server installer during reinstallations and upgrades. Do **not** modify this file in any way.

omproduct.ini

The omproduct.ini file is a system-specific file. It is created during the installation of Content Server to record information about the FatWire products and sample site components that are chosen for installation with Content Server.

Caution

The omproduct.ini file is used by the Content Server installer during reinstallations and upgrades. Do **not** modify this file in any way.

satellite.properties

The satellite.properties file is created on each Content Server system because each Content Server system runs a Satellite servlet. When the Satellite servlet is running in the same virtual machine as the ContentServer servlet, it is said to be "co-resident." Otherwise, it is remote.

satellite.properties is on each server that hosts a Satellite Server application. The function of satellite.properties is to configure the Satellite servlet that it controls.

Properties in the satellite.properties file are organized by function on the following tabs in the Property Editor:

- Caching Tab
- Configuration Tab
- Remote Host Tab
- Sessions Tab
- User Defined Tab

satellite.properties: Caching Tab

The **Caching** tab holds the Satellite Server cache settings.

The file_size property can significantly influence performance. To optimize performance, try to maximize the amount of memory caching. However, be sure that you do not exceed the host's memory capacity.

If you have lots of memory or a relatively small web site, FatWire recommends caching everything to memory by setting a large value. However, in calculating whether your entire web site can fit in memory, remember that expired web pages stay in memory until explicitly removed or until the cache cleaning thread removes them. Be sure to consider this fact when you set the value of the cache_check_interval property.

Properties in satellite.properties: Caching Tab

Property	Description
cache_check_interval	Deprecated.
	Controls the frequency of the cache cleaner thread. Expired objects are not pruned from cache when they expire. They are pruned either when they are requested and found invalid, or when a cache cleaner thread explicitly prunes them.
	In minutes, specify the pause between executions of the cache cleaner thread.
cache_folder	Specifies the location of disk based cache data. If left blank, cached data will be stored in the context's temp folder.
	Default value: blank
cache_max	Specifies the maximum number of objects to maintain in the cache. Objects are removed from the cache if the size specified is exceeded; an LRU method is used to manage cache size limits.

Properties in satellite.properties: Caching Tab (continued)

Property	Description
expiration	Specifies expiration information (in the form of a COM.FutureTense.Util.TimePattern string) of all cached objects that do not have this information specified elsewhere.
	The expiration information for an object can be specified in the cachecontrol attribute on the satellite.page (and related) tags. For pages, expiration information can also be specified in the Site Catalog's sscacheinfo column. For binary objects, the default value for the cachecontrol attribute is specified in the futuretense.ini file.
	Note that the outermost wrapper page of any request cannot specify an override, so this property is the only place where it can be controlled.
	Default value: 5:0:0 */*/*
	This means that everything in the Satellite Server cache expires every day at 5:00 a.m.
	The format is as follows:
	<pre><hours>:<minutes>:<seconds> <daysofweek>/<daysofmonth>/<months></months></daysofmonth></daysofweek></seconds></minutes></hours></pre>
	Possible values:
	• <nours>: 0 through 23, where 0 is midnight</nours>
	• <minutes>: 0 through 59</minutes>
	<seconds>: 0 through 59</seconds><daysofweek>: 0 through 6, where 0 is Sunday</daysofweek>
	• <daysofmonth>: 1 through 31</daysofmonth>
	• <months>: 1 through 12</months>
	Other possible values:
	• never, which means the page can expire only if the cache is full and it is the least recently used page
	• immediate, which means to never cache the page
file_size	Specifies the size (in kilobytes) of objects that can be cached to disk. Smaller objects are retained in memory.
	This value should be adjusted for system RAM, disk speed, etc.
	Default value: 250

satellite.properties: Configuration Tab

The **Configuration** tab holds the properties that configure the Satellite servlet.

Properties in satellite.properties: Configuration Tab

Property	Description
blocktimeout	Deprecated.
	Specifies the number of seconds a request will wait when another thread is in the process of requesting the same data from the host. Waiting helps reduce load on the host server when the cache is empty at the expense of individual user response time.
	Default value: 45
	A value of -1 means wait until the previous thread returns. A value of 0 means never wait.
	This value must be tuned based on the host performance, average request size, and network latency.
	It is safe to use a large number or −1.
password	Specifies the password that the Satellite engine will require for special functions like engine restart or cache reset.
	Be sure to change the username and password from the defaults.
readtimeout	Deprecated.
	Specifies the socket read timeout in seconds, after which a read terminates with an error. A value of 0 leaves the timeout to the Java runtime environment. A value of 3 sets a 3-second wait time.
	Default value: 45
transparent.content- type.pattern	A regular expression denoting content types that may contain nested components such as pagelets, links to other Content Server pages, or links to blobs. Pages whose content types match this pattern will be parsed by Satellite Server.
servlet	Specifies the URL pattern used to identify the Satellite Server servlet. Satellite Server will rewrite links and forms to use this URL pattern if pages are properly designed.
	Default value: Satellite

Properties in satellite.properties: Configuration Tab (continued)

Property	Description
username	Specifies the username that the Satellite engine will require for special functions like engine restart or cache reset. Be sure to change the username and password
	from the defaults.

satellite.properties: Remote Host Tab

The **Remote Host** tab holds properties that define the communications rules between Satellite Server and Content Server. These properties are documented here in alphabetical order:

Properties in satellite.properties: Remote Host Tab

Property	Description
bservice	This value is the servlet path for the Blob Server servlet. It is used to tell Satellite Server where to go to resolve satellite.blob tags.
	Typical values include /NASApp/cs/ BlobServer for iPlanet and /servlet/ BlobServer for servlet runners.
host	The name of the remote host system running Content Server that the Satellite engine is caching requests for.
	This is required and there is no default.
port	The port number for communicating with the Content Server host.
	Default value: 80
protocol	The communication protocol between the Satellite Server host and the Content Server host. (Generally http://or https://).
	Note that setting the protocol to https://will not, in itself, ensure secure communications. You will still need to get a certificate.
service	This value is the servlet path for the Content Server servlet.
	It is used to tell Satellite Server where to go to resolve satellite.page tags.
	Typical values include /NASApp/cs/ ContentServer for iPlanet and /servlet/ ContentServer for servlet runners.

satellite.properties: Sessions Tab

The **Sessions** tab holds properties that provide information about how the Satellite servlet should interpret a user's browser session.

Properties in satellite.properties: Sessions Tab

Property	Description
contentserver.installation. folder	Replaces the path.to.futuretense.ini property. Applies to installations in which Satellite Server and Content Server are running in the same web application and must therefore share the user's session. This property specifies the path to the Content Server installation, enabling Satellite Server to access Content Server's resources, such as the system asset root and the futuretense.ini file.
	Possible values:
	• blank, if Satellite Server is running in a web application other than Content Server.
	• <cs_installation_dir> if Satellite Server is running in the same web application as Content Server. This directory contains the futuretense.ini file.</cs_installation_dir>
cookieprefix	Satellite Server maintains a session between itself and the remote host on behalf of the client. Satellite Server needs to know the name of the session ID cookie the application server uses so that it can be properly tracked.
	Enter the possible session cookie name prefixes here, separated by a semicolon. If left blank, a default set will be used.
path.to.futuretense.ini	Replaced with: contentserver.installation.folder

Properties in satellite.properties: Sessions Tab (continued)

Property	Description
sessionid.cookie.prefix	Users can now specify the prefix that is prepended to the session id cookie.
	The session id cookie is the session id cookie for the host (i.e., Content Server). Satellite Server needs to pass the session id cookie to the client in order to maintain a session between Content Server and the client.
	The cookie must be renamed, so it does not conflict with the session cookie that Satellite Server itself uses. The configurable prefix allows users who know the name of the session id cookie to construct the full cookie name. This can be used in a servlet filter or other mechanism to support custom functionality.
sharesession	Specifies whether the ContentServer servlet and the Satellite servlet share the user session.
	If Satellite Server is running remotely, set this to false; if Satellite Server and ContentServer are co-resident, set this property to true.
	If this property is not set appropriately, user- specific information may be inconsistent between pages.

satellite.properties: Compatibility Tab

Properties in satellite.properties: Compatibility Tab

Property	Description
formaction	The Satellite servlet converts Content Server URLs that you GET or POST to into Satellite URLs. This property specifies which string to replace in the Content Server URL to create a Satellite URL.
	This value is case sensitive.
	Effective in Satellite Server 6, use the new satellite.form tag for all forms.
newformaction	Specifies the replacement string in URLs to be GET'ed or POST'ed to the locally mapped servlet. This value is case sensitive.
	Effective in Satellite Server 6, use the new satellite.form tag for all forms.
globally_replace_content server	If this property is set to true, Satellite Server will parse through all processable pages returned from Content Server and replace all instances of the string described by the formaction property with the string described by the newformaction property. It will also replace any occurrence of ContentServer with the string described by the servlet property.
	Effective in Satellite Server 6, use satellite.link or RENDER.GETPAGEURL for links and satellite.form for forms. If this is not possible, set this property to true.
	Default value: false

satellite.properties: User Defined Tab

Properties in satellite.properties: User Defined Tab

Property	Description
appserverlink	Deprecated. Value: 45
servlet-path	Deprecated. Value: /spark/
propagatecache	Used to enable the propagation of pages among nodes that are enabled for inCache page caching. Information about inCache can be found in the <i>Content Server Developer's Guide</i> .
scratch.cleanup.schedule	Specifies the frequency, in minutes, of the event that runs to clean up files in the Scratch folder generated by Satellite Server caching. The frequency should be determined from the volume of pages loaded into cache and the file_size property (in the satellite.properties file). The default location of the Scratch folder depends on the application server. The path can be configured by setting the cache_folder property (in the satellite.properties file).
	Default value: 2

ServletRequest.properties

The ServletRequest.properties file holds properties that specify configurations for certain types of requests (for example, a portal request or a Satellite Server request).

Properties in the ServletRequest.properties file are organized by function on the following tabs in the Property Editor:

- Request Encoding Tab
- Request Threshold Tab
- URI Assembler Tab
- User Defined Tab

ServletRequest.properties: Request Encoding Tab

Properties in ServletRequest.properties: Request Encoding Tab

Property	Description	
cs.charset	The name of the optional parameter that defines the character encoding of the input.	
cs.contenttype	The default content type string used when streaming text. For example:	
	For UTF-8: text/html; charset=UTF-8 for UTF-8	
	For Latin1: text/html; charset=iso-8859-1	
	Default value: text/html	
cs.contenttype.UTF-8	The preferred content type string used when decoding incoming http parameters. This property is designed for use with Japanese language installations, where the user intends to override shift_jis with a special encoding.	
	For example: In Japanese environments with encoding such as Cp943C, set the value to: cs.contenttype.shift_jis=Cp943C	
	Default value: set by cs.contenttype	

ServletRequest.properties: Request Threshold Tab

Properties in ServletRequest.properties: Request Threshold Tab

Property	Description
cs.disksize	Defines the maximum size of a binary blob in a page request that will be held in memory. Anything exceeding this size will be saved in a temporary file until it is needed.

ServletRequest.properties: URI Assembler Tab

 $\label{properties:Request_Properties:Request_Encoding} \ Tab$

Property	Description
	•
path.BlobServer	The servlet context path for the Blob Server servlet.
	Typical values:
	/cs/BlobServer
	/servlet/BlobServer
path.CacheServer	The servlet context path for the Cache Server servlet.
	Typical values:
	/cs/CacheServer
	/servlet/CacheServer
path.CatalogManager	The servlet context path for the Catalog Manager servlet.
	Typical values:
	/cs/CatalogManager
	/servlet/CatalogManager
path.ContentServer	The servlet context path for the Content Server servlet.
	Typical values:
	/cs/ContentServer
	/servlet/ContentServer
path.CookieServer	The servlet context path for the Cookie Server servlet.
	Typical values:
	/cs/CookieServer
	/servlet/CookieServer
path.DispatchManager	The servlet context path for the Dispatch Manager servlet.
	Typical values:
	/cs/DispatchManager
	/servlet/DispatchManager
path.PageDispatchServer	The servlet context path for the Page Dispatch Server servlet.
	Typical values:
	/cs/PageDispatchServer
	/servlet/PageDispatchServer

Properties in ServletRequest.properties: Request Encoding Tab (continued)

Property	Description
path.SatelliteServer	The servlet context path for the Satellite Server servlet on the host that will be most often accessed. Forced Satellite Server URIs will use this path as the servlet context path.
	Typical values:
	/cs/Satellite /servlet/Satellite
path.SeedDispatchServer	The servlet context path for the Seed Dispatch Server servlet.
	Typical values:
	/cs/SeedDispatchServer /servlet/SeedDispatchServer
path.SyncSeedDispatch Server	The servlet context path for the Sync Seed Dispatch Server servlet.
	Typical values:
	/cs/SyncSeedDispatchServer /servlet/SyncSeedDispatchServer
path.TreeManager	The servlet context path for the Tree Manager servlet.
	Typical values:
	/cs/TreeManager
	/servlet/TreeManager
uri.assembler.1.classname	Specifies the classname for the default URI assembler to be used by this instance of Content Server. Users may override this value and specify a different assembler that conforms to the com.fatwire.cs.core.uri.Assembler interface.
	If the assembler specified by this class is unable to decode a URI, then Content Server will attempt to use the next ranked assembler to decode the URI. This process will continue until the URI is decoded.
uri.assembler.1.shortform	Specifies the short form name for the corresponding URI assembler. The short form is the name passed into geturi methods to identify which assembler to use; it is a nickname for the assembler.

Properties in ServletRequest.properties: Request Encoding Tab (continued)

Property	Description
uri.assembler.2.classname	Specifies the classname for the second URI assembler to be used by this instance of Content Server. Users may override this value and specify a different assembler that conforms to the com.fatwire.cs.core.uri.Assembler interface.
	If the assembler specified by this class is unable to decode a URI, then Content Server will attempt to use the next ranked assembler to decode the URI. This process will continue until the URI is decoded.
uri.assembler.2.shortform	Specifies the short form name for the corresponding URI assembler. The short form is the name passed into geturi methods to identify which assembler to use; it is a nickname for the assembler.
uri.assembler.3.classname	Specifies the classname for the third URI assembler to be used by this instance of Content Server. Users may override this value and specify another assembler that conforms to the com.fatwire.cs.core.uri.Assembler interface.
	If the assembler specified by this class is unable to decode a URI, then Content Server will attempt to use the next ranked assembler to decode the URI. This process will continue until the URI is decoded.
uri.assembler.3.shortform	Specifies the short form name for the corresponding URI assembler. The short form is the name passed into geturi methods to identify which assembler to use; it is a nickname for the assembler.

ServletRequest.properties: User Defined Tab

Properties in ServletRequest.properties: User Defined Tab

Property		Description	
	Note: This tal	b, by default, has no properties.	

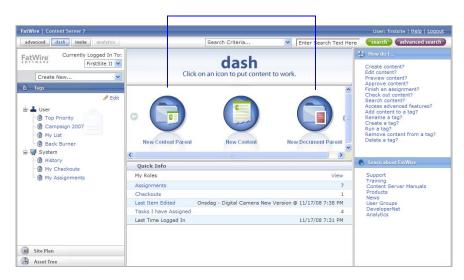

ui.properties

The ui.properties file is used to configure portions of Content Server's Dash interface:

• startmenu properties are used to customize start menus in the quick access pane (start menus provide an easy way for content providers to create assets). For more information, see "Customizing Start Menus" on page 167.

Figure 1: Customizing Start Menus (in the Quick Access Pane)

startmenu properties are used to customize start menus

• learnmorelink properties are used to create links to user-selected URLs in the "Learn More about FatWire" pane. For more information, see "Customizing "Learn About FatWire" Links" on page 168.

Figure 2: Customizing Links in the "Learn About FatWire" Pane

Customizing Start Menus

By default, all start menus in the quick access pane are displayed by name, along with a default icon, as shown in Figure 1, on page 166. You have several configuration options:

- Customize the names and/or icons of start menu items for core asset types by
 modifying the startmenu properties in ui.properties (located in
 <CS_APP_NAME>/WEB-INF/classes/).
- Customize the names and/or icons of start menus for custom asset types by adding your own properties to ui.properties.

The syntax for startmenu properties is shown below. Default startmenu properties (for core asset types) are listed on page 171.

Syntax

```
startmenu.<cs_startmenu_name>.TEXT=<ui_startmenu_name>
startmenu.<cs_startmenu_name>.IMAGE=<path_to_image_file>
```

• <cs startmenu name>

Start menu name used by the Content Server system. <cs_startmenu_name> takes the form NEW_<ASSET_TYPE>, in uppercase characters. Spaces must be replaced with the underscore character (_). (For example, New Article must be converted to: NEW_ARTICLE)

- <ui_startmenu_name>
 Name of the start menu as it would appear in the quick access pane (for example, Create Article).

(.jpg and .gif are recommended, although any browser-supported format is valid).

If no value is set for a startmenu property, the default start menu name (or Default_large.jpg icon) is used.

Example

To customize the name of the start menu for creating assets of type Article:

```
startmenu.NEW_ARTICLE.TEXT=Create Article
```

To customize the start menu icon:

```
startmenu.NEW_ARTICLE.IMAGE=../images/en_US/scroller/
AArticle_large.jpg
```

Customizing "Learn About FatWire" Links

By default, links in the "Learn More about FatWire" pane point to the sites shown in Figure 2, on page 166. The links can be renamed, pointed to different URLs, deleted, or supplemented with additional links. For property syntax and examples, see the rest of this section. For a listing of default learnmorelink properties, see page 169.

Syntax

learnmorelink.<nn>=<link_name>**<url>

- <nn>
 - 2-digit integer whose value specifies the position of the link in the list (01 at the top)
- link_name>
 Name to display in the "Learn More about FatWire" panel
- <ur><url>Url>Destination site

Example

learnmorelink.01=Support**http://www.fatwire.com/cs/Satellite/
 SupOverviewPage_US.html

(Creates the **Support** link in the "Learn More about FatWire" pane; see Figure 2.)

Default Properties in ui.properties

This section describes the learnmorelink properties (for default help topics) and startmenu properties for core asset types. For information about the properties' usage and syntax, see pages 167–168.

Properties in the ui.properties file are organized by function on the following tabs in the Property Editor

- General Tab
- Start Menu Tab
- User Defined Tab

ui.properties: General Tab

Default Properties in ui.properties: General Tab

Property Pro	
Property	Description
learnmorelink.01	Defines the Support link, listed in the "Learn More about FatWire" pane.
	<pre>Default value: Support**http:// www.fatwire.com/cs/Satellite/ SupOverviewPage_US.html</pre>
learnmorelink.02	Defines the Training link, listed in the "Learn More about FatWire" pane.
	Default value: Training**http://www.fatwire.com/cs/Satellite/TrainingOVPage_US.html
learnmorelink.03	Defines the Content Server Manuals link, listed in the "Learn More about FatWire" pane.
	Default value: ContentServer
	Manuals**http:// e-docs.fatwire.com
	e-docs.latwire.com
learnmorelink.04	Defines the Products link, listed in the "Learn More about FatWire" pane.
	<pre>Default value: Products**http:// www.fatwire.com/cs/Satellite/ CSPage_US.html</pre>
learnmorelink.05	Defines the News link, listed in the "Learn More about FatWire" pane.
	Default value: News**http://
	www.fatwire.com/cs/Satellite/
	NewsPRPage_US.html

Default Properties in ui.properties: General Tab (continued)

Property	Description
learnmorelink.06	Defines the User Groups link, listed in the "Learn More about FatWire" pane.
	Default value: User Groups**http:// tech.groups.yahoo.com/group/ips- link/
learnmorelink.07	Defines the DeveloperNet link, listed in the "Learn More about FatWire" pane.
	Default value: DeveloperNet**http://developernet.fatwire.com
learnmorelink.08	Defines the Analytics link, listed in the "Learn More about FatWire" pane.
	Default value: Analytics**http:// www.fatwire.com/cs/Satellite/ CSPage_US/SubPage/Products- Analytics.html

ui.properties: Start Menu Tab

Default Properties in ${\tt ui.properties}$: StartMenu Tab

Property	Description	
startmenu.NEW_ATTRIBUTE_ EDITOR.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Attribute_Editor.	
	Default value:/images/en_US/ scroller/Default_large.jpg	
startmenu.NEW_COLLECTION. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Collection (system-defined).	
	Default value:/images/en_US/ scroller/Collection_large.jpg	
startmenu.NEW_CSELEMENT. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type CSElement (system-defined).	
	Default value:/images/en_US/ scroller/CSElement_large.jpg	
startmenu.NEW_DIMENSION. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Dimension (system-defined).	
	Default value:/images/en_US/ scroller/Locale_large.jpg	
startmenu.NEW_DIMENSIONSET. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Dimensionset (system-defined).	
	Default value:/images/en_US/ scroller/Default_large.jpg	
startmenu.NEW_HISTORY_ ATTRIBUTE.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type HistoryAttribute (system-defined).	
	Default value:/images/en_US/scroller/HFields_large.jpg	
startmenu.NEW_HISTORY_ DEFINITION.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type History_Definition (system-defined).	
	Default value:/images/en_US/ scroller/HistoryVals_large.jpg	

Default Properties in ui.properties: **StartMenu** Tab (continued)

Property	Description
startmenu.NEW_LINK.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Link (system-defined).
	Default value:/images/en_US/ scroller/Linkset_large.jpg
startmenu.NEW_PAGE.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Page (system-defined).
	Default value:/images/en_US/ scroller/Page_large.jpg
startmenu.NEW_PROMOTION. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Promotion (system-defined).
	Default value:/images/en_US/ scroller/Promotions_large.jpg
startmenu.NEW_QUERY.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Query (system-defined).
	Default value:/images/en_US/ scroller/Query_large.jpg
startmenu.NEW_RECOMMENDA TION.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Recommendation (system-defined).
	Default value:/images/en_US/ scroller/AdvCols_large.jpg
startmenu.NEW_SEGMENT.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Segment (system-defined).
	Default value:/images/en_US/ scroller/Default_large.jpg
startmenu.NEW_SITEENTRY. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type SiteEntry (system-defined).
	Default value:/images/en_US/ scroller/SiteEntry_large.jpg

Default Properties in ui.properties: **StartMenu** Tab (continued)

Property	Description
startmenu.NEW_TEMPLATE. IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Template (system-defined).
	Default value:/images/en_US/ scroller/Template_large.jpg
startmenu.NEW_VISITOR_ ATTRIBUTE.IMAGE	Specifies an image file for display as a start menu icon, used to create assets of type Visitor_Attribute (system-defined).
	Default value:/images/en_US/ scroller/Default_large.jpg

ui.properties: User Defined Tab

Default Properties in ui.properties: User Defined Tab

Property		Description
Note: This tab, by default, holds no properties.		

uiadmin.properties

The uiadmin.properties file is used to customize selected portions of the Dash interface: the login page, site selection screen, search results lists, and help links in the right navigation pane.

Figure 3: Content Server's Login Page

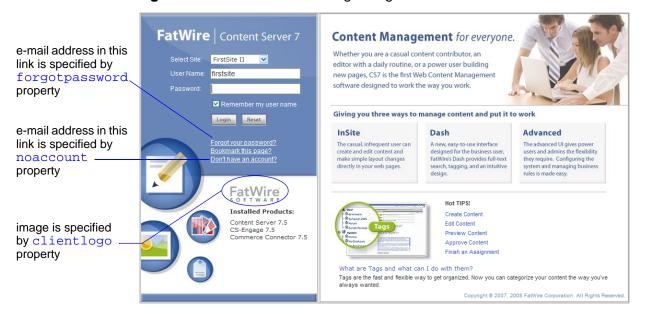

Figure 4: Content Server's Dash Interface

Properties in the uiadmin.properties file are organized by function on the following tabs:

- Config Tab
- General Tab

uiadmin.properties: Config Tab

Properties in uiadmin.properties: Config Tab

· · · · · · · · · · · · · · · · · · ·	
Property	Description
cascadedmaxitems	Specifies the maximum number of items that can be displayed in a cascaded menu. This property applies to the right-click menus in the Dash interface.
cs.batchtimeout	Specifies the time (in seconds) between Content Server requests before the application server invalidates the batch session, typically used by publishing. A negative time indicates that the session should never time out.
	A batch session is launched for long-running processes in the background (typically used for publishing). Since the process runs in the context of an appserver session (HttpSession), it is subject to that session's timeout. To avoid batch session timeouts, this setting must be larger than the longest anticipated batch (i.e., publishing) sessions.
	Legal value: from -2147483648 to 2147483647
display.assettree.leaf	Specifies whether to display nodes in the Asset tree of the Dash interface (true displays the nodes).
	Default value: true
display.siteplantree.leaf	Specifies whether to display nodes in the Site Plan tree of the Dash interface (true displays the nodes).
	Default value: true

Properties in uiadmin.properties: Config Tab (continued)

Property	Description
howdoilink. <nn></nn>	Specifies the name of the help link (topic) and the file to which the link points. The help link is displayed in the "How do I" pane of Content Server's Dash interface, as shown in Figure 4, on page 174. The 2-digit suffix (<nn>) determines the position of the help link in the list (01 at the top).</nn>
	<pre>Legal value: <link_name>**// resources/rightnav/en_US/ <help_file_name></help_file_name></link_name></pre>
	Example: Create Content?**// resources/rightnav/en_US/ AssetsCreating.pdf
popupsearchtablerowcount	Specifies the number of rows per page in the pop- up search results table of the Dash interface. The pop-up table is available in the attributes where a dependent asset must be selected (from the table) for the current asset).
	Default value: 10
searchresultscount	Specifies the maximum number of search results that can be returned by the Lucene search engine in the Dash interface.
	Default value: 500
searchtableattrcols	Specifies which columns are displayed in the search results list in the Dash interface. Columns are specified as a comma-separated list. Custom columns cannot be added.
	Default value: No default value is set. The following columns are displayed: name, assettype, updateddate, locale, startdate, enddate, description
	(By default, each asset's description is displayed as an icon.)
searchtablerowcount	Specifies the number of rows per page in the search results list in the Dash interface.
	Default value: 25

Properties in uiadmin.properties: Config Tab (continued)

Property	Description
sitestablerowcount	Specifies the number of rows per page on the site selection screen. The screen is displayed when users with access to multiple content management sites log in to Content Server.
	Default value: 25

uiadmin.properties: General Tab

Properties in uiadmin.properties: General Tab

Property	Description
clientlogo	Specifies an image file for display on Content Server's login page, at the location shown in Figure 3, on page 174. The image is stored in: <cs_app_name>/images/en_US</cs_app_name>
	Legal value: <image_file_name> (.jpg and .gif are recommended, although any browser-supported format is valid)</image_file_name>
	Default value: login_pane_left_client_logo.jpg
clientlogodash	Specifies an image file for display in Content Server's Dash interface, at the location shown in Figure 4, on page 174. The image is stored in: <cs_app_name>/images/en_US</cs_app_name>
	Legal value: <image_file_name> .jpg and .gif are recommended, although any browser-supported format is valid.</image_file_name>
	Default value: client_logo_dash.gif
forgotpassword	Specifies the e-mail address that should receive notices from users regarding forgotten passwords. This property sets the e-mail address for the Forgot your password link on Content Server's login page (Figure 4, on page 174).
	Legal value: <e-mail address=""></e-mail>
	Default value: admin@fatwire.com

Properties in uiadmin.properties: **General** Tab (continued)

Property	Description
helplink	Specifies a URL for the Help link in the upper right-hand corner of Content Server's Dash interface (Figure 4, on page 174).
	Legal value: <url></url>
	<pre>Default value: http://e-docs.fatwire. com/CSEE/7.0.0?cslocale=</pre>
	(FatWire's Content Server documentation site)
noaccount	Specifies the e-mail address that should receive notices from users who require a Content Server account. This property sets the e-mail address for the Don't have an account? link on Content Server's login page (Figure 4, on page 174).
	Legal value: <e-mail address=""></e-mail>
	Default value: admin@fatwire.com

visitor.ini

The visitor.ini file is installed by Content Server; however, the properties in the file configure Engage rather than Content Server. The properties configure the visitor data collection and other features provided by Engage.

Properties in the visitor.ini file are organized by function on the following tabs in the Property Editor:

- Visitor Data Tab
- User Defined Tab

visitor.ini: Visitor Data Tab

The **Visitor Data** tab holds the main properties in the file.

Properties in visitor.ini: Visitor Data Tab

Property	Description
vis.adminrole	Specifies the ACL that Engage users need in order to work with the visitor attribute, history attribute, history type, and recommendation asset types.
	Default value: VisitorAdmin
	Do not change the value of this property.
vis.compileclasspath	Specifies the classpath against which to compile the rules.
	This value is set during the installation and should not be changed after that point.
vis.editrole	Specifies the ACL that two kinds of Engage users need:
	• Content providers who use the CS system to create segments and promotions.
	• The visitors to your online site when you are using Engage to gather information about them for segments.
	Default value: Visitor
	Do not change the value of this property.
vis.genclasspath	Specifies the directory (including the final slash character) where rules-engine-generated class files for visitor data are stored.
	This value is set during the installation and should not be changed after that point.

Properties in visitor.ini: Visitor Data Tab (continued)

Property	Description
vis.money	Specifies the SQL string for defining fields that hold monetary values.
	Do not change the value of this property without consulting your database administrator.
vis.path	Specifies the directory that holds the ruleset.dtd file, which is usually the installation directory. This value is set during installation.
	Do not change the value of this property.
vis.rulesetxmlpath	Specifies the defdir (default storage directory) for the XML versions of the rule sets.
	This value is set during installation.
	Do not change the value of this property.
vis.sessiondata	Specifies the defdir (default storage directory) for storing visitor session data.
	This value is set during installation.
	Do not change the value of this property.
vis.update	Specifies whether every page access will update the visitor timestamp in the visitor data.
	Possible values: true false
	Set to true if you want every page access to update the visitor timestamp in the visitor data; false otherwise.
	Default value: true
vis.url	Specifies the SQL string for defining visitor and history attributes of type URL.
	Default value: VARCHAR (128)
	Do not change the value of this property without consulting your database administrator.
vis.urlpath	Specifies the defdir for binary visitor and history attributes.
	Default value: /futuretense/visurl/

Properties in visitor.ini: Visitor Data Tab (continued)

Property	Description
vis.useSessionVisitorConn ection	This property determines whether Engage visitors will be tracked via the database- or memory-centric method, which improves the performance of heavily trafficked sites featuring Engage assets. In memory-centric tracking, Content Server stores visitor scalar attribute values to the add-on repository, and visitor history attribute values to its own database. All computations to determine a visitor's segments are performed in memory; results are cached.
	By default, this property is not automatically included in visitor.ini, in which case its value is understood to be false (i.e., database-centric).
	This property must be set on the delivery system in one of the following ways:
	• If you wish to enable the database-centric method, set this property to false, leave it blank, or omit it from the file.
	• If you wish to enable the memory-centric method, set this property to true and ensure that supporting template code exists on the delivery system (in its absence, Engage visitors will be incorrectly tracked). For information about required code, see "Memory-Centric Visitor Tracking" in the Engage section of the Content Server Developer's Guide.
	On content management systems, this property must be either set to false or omitted, given that visitor attributes are created and managed only on CM systems that are enabled for database-centric tracking. Management of visitor attributes is not supported on delivery systems; the attributes must be published to the delivery systems.

visitor.ini: User Defined Tab

Properties in visitor.ini: User Defined Tab

Property		Description	
	Note: This tal	b, by default, has no properties.	

WL6.ini

The WL6.ini file contains properties that define the installation options that are chosen for Content Server during its installation on WebLogic.

Properties in the WL6.ini file are organized by function on the following tab in the Property Editor:

• User Defined Tab

Caution

Do **not** change the values of any properties on this tab.

WL6Props.ini: User Defined Tab

Properties in WL6Props.ini: User Defined Tab

Property	Value
Version	8
WebAppName	spark
WLApplicationDir	<pre>C:\bea\user_projects\applications\Spa rkApp\applications\spark</pre>
DomainName	portalDomain
RunningDefaultWebApp	Deprecated.
	Used to specify an installation on a managed node. This functionality is not supported in WebLogic versions higher than 9.2.
	Variables.bRunningDefaultWebApp
WLDomainDir	<pre>C:\bea\user_projects\applications\Spa rkApp</pre>
ContextRoot	/spark/
ServerName	Deprecated.
	Variables.CSInstallWLServerName
PoolName	Deprecated.
	Variables.CSInstallPoolName

xmles.ini

The xmles.ini file configures the CS-Bridge XML module that is installed as part of the core Content Server product.

Properties in the xmles.ini file are organized by function on the following tabs in the Property Editor:

- General Properties Tab
- Parsing Tab
- Inbound Handlers Tab
- User Defined Tab

xmles.ini: General Properties Tab

Properties in xmles.ini: General Properties Tab

Property	Description
wc.icUploadDir	Specifies the path to the base directory where all CS-Bridge XML documents entered in the InBound, OutBound and DTD catalogs are stored. Default value: c:/FutureTense
	Default value: c:/FutureTense

xmles.ini: Parsing Tab

Properties in xmles.ini: Parsing Tab

Property	Description
wc.enableCacheRet	Specifies whether or not the DTD should be returned from the cache if the remote system is down.
	Default value: true
	Set to false if you want the default parser behavior instead.
wc.validate	Specifies whether an incoming document must specify a grammar. When this property is set to false, the incoming document must be wellformed XML only (no grammar is required). Default value: false

xmles.ini: Inbound Handlers Tab

Properties in xmles.ini: Inbound Handlers Tab

Property	Description
InboundHandler0,Inbound Hanlder1,	The class that implements the inbound handler. Handlers are invoked in order, starting with InboundHandler0.
	Default value: com.openmarket.xmles. handlers.HTTPPostHandler.
numHandlers	Specifies the number of inbound handlers to be configured.
	This value also specifies how many InboundHandler properties appear on this tab (the Inbound Handlers tab). If you set this value to 2, there are two additional properties on the tab, one for each handler, named InboundHandler0 and InboundHandler1.
	Possible values: integer greater than 0

xmles.ini: User Defined Tab

Properties in xmles.ini: User Defined Tab

Property	Description
Note: This tab, by default, has no properties.	

Part 2

Content Server Applications

This part lists the property files that are used by FatWire Analytics and the Content Server applications, Engage and Satellite Server.

This part contains the following sections:

- Analytics Properties
- Engage Property Files
- Satellite Server Property Files

Analytics Properties

FatWire Analytics requires that several properties in the futuretense_xcel.ini property file be set after Analytics is installed. These properties are described in "Analytics Tab" on page 106.

Engage Property Files

Engage installs one property file, named ${\tt ms.ini}$, which holds only the ${\tt ms.enable}$ property.

ms.ini

Properties in ms.ini

Property	Description
ms.enable	Set to true when Engage is installed and enabled.

Note

Engage configuration properties are located in the Content Server property file named visitor.ini (page 179).

Satellite Server Property Files

When you install Satellite Server as a stand-alone application on a remote server, the satellite properties file is present on that server. For more information about the properties, see "satellite properties" on page 151.

Part 3

Third-Party Libraries and Applications

This part contains information about third-party libraries, as well as applications, and how Content Server integrates with them.

This part contains the following section:

• HTTP Client Access

HTTP Client Access

This section describes the Apache Commons HttpClient library and how Content Server integrates with this library.

Apache Commons HttpClient

Content Server uses Apache Commons HttpClient as the underlying library for all HTTP access. As of version 3, HttpClient supports the parameters that are posted at: http://jakarta.apache.org/commons/httpclient/preference-api.html

The parameters function as follows:

- HttpClient parameters change the runtime behavior of HttpClient components. For example, if you want the Post operation to have a timeout that differs from the default, you can call PostMethod.getParams().setParam("timeout", 1000) before executing it.
- HttpClient parameters can be hierarchically linked.
 In top-down order, the levels of the hierarchy are: global, client, host, and method.
 Values that are set for parameters at higher levels are overridden by the values of equivalent parameters at lower levels.

Despite its flexibility, HttpClient has a limitation; that is—parameters can be set only programmatically. No configuration file can be written where parameter values can be specified by users or automatically retrieved by the library. The Content Server integration, however, overcomes this limitation as explained in the next section "Integration with Content Server."

Note

This release of Content Server uses the parameters that are posted at http://jakarta.apache.org/commons/httpclient/preference-api.html at the time of this writing (September 2005). The parameters are listed in the table "HttpClient Parameters," on page 193, along with descriptions (duplicated from the site named above). Changes to parameters and their functionality as defined by HttpClient are not automatically supported.

Integration with Content Server

Content Server abstracts HttpClient functionality by allowing Content Server users to create user-configurable property files. After creating the files, users populate them with the required HttpClient parameters (that is, parameters whose values differ from the default values), and place the property files into the classpath. Content Server loads the property files from the classpath and parses the parameters according to a predefined syntax (shown in the table "HttpClient Parameters," on page 193). The HttpAccess API retrieves the parameters and applies them at runtime.

Content Server supports a parameter hierarchy whose levels correspond directly to the levels that are defined in the HttpAccess Java API (provided in *Content Server Java Docs*). For each level, one or more property files can be created, depending on the

implementation, and populated with *any combination* of HttpClient parameters. The levels and property file naming conventions are given below:

Note

The property files must be created as text files, outside Content Server's Property Editor. Property file names are case sensitive and must be in lower case throughout.

• HttpAccess (level 1)

Property File: httpaccess.properties

The user specifies parameters and their values in the httpaccess.properties file. This file is applied to all

HttpAccess instances that are created.

Overrides: Parameter values at the HttpAccess level are overridden by the values

of equivalent parameters at levels 2, 3, and 4 (described below).

HostConfig (level 2)

The user specifies host-specific parameters in each property file. For example, for a host named targetserver accessible at port 7001, the property file would be named http-targetserver-7001.properties and would contain HttpClient parameters

specific to that host.

Overrides: Parameter values at the HostConfig level override the values of

equivalent parameters at the HttpAccess level.

Request (level 3)

Property File: <request type>.properties

where < request type> takes one of the following values: post,

get, or login.

The user specifies parameters specific to a Request. For example, post.properties specifies HttpClient parameters applicable to

instances of post.

Overrides: Parameter values at the Request level override the values of

equivalent parameters at the HttpAccess and HostConfig levels.

• Per host, per Request (level 4)

Property File: <request type>-<protocol>-<host name>-

<port number>.properties

where <request type> takes one of the following values: post,

get, or login.

Parameters in this property file function as Request level parameters.

However, they apply to a specific host.

Overrides:

Parameter values specified at the "Per host, per Request" level override the values of equivalent parameters at the HttpAccess, HostConfig, and Request levels *for that particular host*.

The following example illustrates how an override takes effect from the "Per Host, Per Request" level. In this example, a user defines a property file named login-http-m2-7002.properties, where she specifies an http.connection.timeout of 100 seconds. The timeout applies strictly to the host machine named m2 and port 7002. The timeout value overrides all timeout values that might be specified for m2 at higher levels. For all other host machines, the timeout values remain unaffected.

Content Server supports all parameters defined by HttpClient in an externally configurable way. Furthermore, Content Server extends HttpClient functionality by enabling users to configure parameters externally and facilitating the specification of parameters at the fourth level (per host, per request).

In addition to all the parameters supported by HttpClient, Content Server's HttpAccess API defines a configuration property cs.SecureProtocolSocketFactory in httpaccess.properties. This property specifies the protocol socket factory to be used for SSL (Secure Socket Layer) connections. Three implementations are available at http://jakarta.apache.org/commons/httpclient/sslguide.html. Note that if you want to use SSL to connect to a host using self-signed certificates, you must configure the following:

cs.SecureProtocolSocketFactory=org.apache.commons.httpclient. contrib.ssl.EasySSLProtocolSocketFactory

Content Server does not provide this EasySSLProtocolSocketFactory class. You can obtain this class at http://jakarta.apache.org/commons/httpclient/sslguide.html. Make sure to build it differently for Sun and IBM JDKs, as the Apache implementation (at the link directly above) is Sun-specific. Alternatively you can write your own Socket factory implementation based on HttpClient documentation.

Note that there are two levels—connection manager and connection—in the HttpClient hierarchy for which parameters cannot be explicitly set, as the HttpAccess API does not directly support them. However, this does not mean users cannot configure those parameters; the parameters can be specified at a lower or higher corresponding level in the HttpAccess API.

Implementation

How does the Content Server user configure Content Server for http access? The user simply creates property files with appropriate names and places them in the classpath. The infrastructure will retrieve and use them. This seems like a good deal of work, especially given the number of parameters. However, by default, no properties or property files need to be created. All defaults will be used, and HttpClient takes the "best guess" values, which are usually the best settings for the given system. In 95% of the cases, "best guess" values are sufficient and users need not create any property files.

In the rare cases when one needs parameter values other than defaults, the Content Server infrastructure makes it possible to implement them by allowing the user to specify configuration in property files. This gives the user the full range of configuration capabilities that HttpClient itself is built upon.

HTTPClient Parameters and Content Server Properties

The table in this section describes the parameters that are supported by Apache Commons HttpClient in September 2005. Descriptions in the table are duplicated from the following site:

http://jakarta.apache.org/commons/httpclient/preference-api.html

Syntax and default values are defined by FatWire, as they are specific to Content Server. Where syntax is straightforward, the "Syntax" field in the table below is left blank.

Note that changes to the parameters and their functionality are not automatically supported. Information in the table below is valid until FatWire issues an update.

In addition to supporting HttpClient parameters, Content Server defines the following property:

Property: cs.SecureProtocolSocketFactory

Usage: applicable only to the httpaccess.properties file **Description:** defines the class used opening SSL Socket connections

Default: empty. The system will use the JSSE-based default implementation of

HttpClient. Details are available at: http://jakarta.apache.org/

commons/httpclient/sslguide.html

HttpClient Parameters

Name	Description
http.authentication. preemptive	Defines whether authentication should be attempted preemptively.
	Type: Boolean
	Default value: <undefined></undefined>
http.connection. stalecheck	Determines whether stale connection check is to be used. Disabling stale connection check may result in slight performance improvement at the risk of getting an I/O error when executing a request over a connection that has been closed at the server side. Type: Boolean Default value: <undefined></undefined>
http.connection. timeout	The timeout until a connection is established. A value of zero means the timeout is not used.
	Type: Integer
	Default value: <undefined></undefined>

Name	Description
http.connection-	The default HTTP connection manager class.
manager.class	Type: Class
	Syntax: Fully qualified classname
	Default value: SimpleHttpConnectionManager class
http.connection- manager.max-per-host	Defines the maximum number of connections allowed per host configuration. These values only apply to the number of connections from a particular instance of HttpConnectionManager. This parameter expects a value of type Map. The value should map instances of HostConfiguration to Integer s. The default value can be specified using ANY_HOST_CONFIGURATION.
	Type: Map
	<pre>Syntax: Specify \${<host>;<port>;<pre>;<pre>connections>}</pre></pre></port></host></pre>
	Default value: <undefined></undefined>
http.connection- manager.max-total	Defines the maximum number of connections allowed overall. This value only applies to the number of connections from a particular instance of HttpConnectionManager.
	Type: Integer
	Default value: <undefined></undefined>
http.connection- manager.timeout	The timeout in milliseconds used when retrieving an HTTP connection from the HTTP connection manager.
	Type: Long
	Default value: <undefined></undefined>

Name	Description
http.dateparser. patterns	Date patterns used for parsing. The patterns are stored in a Collection and must be compatible with SimpleDateFormat.
	Type: Collection
	Syntax: Specify the collection with each element enclosed in \${ <element>}. e.g., \${EEE, dd-MMM-yyyy HH-mm-ss z}\${EEE, dd MMM yy HH:mm:ss z}</element>
	Default value: EEE, dd MMM yyyy HH:mm:ss zzz EEEE, dd-MMM-yy HH:mm:ss zzz EEE MMM d HH:mm:ss yyyy EEE, dd-MMM-yyyy HH:mm:ss z EEE, dd-MMM-yyyy HH-mm-ss z EEE, dd MMM yy HH:mm:ss z EEE dd-MMM-yyyy H:mm:ss z EEE dd-MMM-yyyy HH:mm:ss z EEE dd-MMM-yyyy HH:mm:ss z EEE dd-MMM-yyyy HH:mm:ss z EEE dd-MMM-yyyy HH:mm:ss z EEE, dd-MMM-yy HH:mm:ss z EEE, dd-MMM-yy HH:mm:ss z EEE, dd-MMM-yy HH:mm:ss z EEE, dd-MMM-yyyy HH:mm:ss z
http.default-headers	The request headers to be sent per default with each request. This parameter expects a value of type Collection. The collection is expected to contain HTTP headers.
	Type: Collection
	Syntax: Specify each header in \${name= <header name="">; value=<header value="">}</header></header>
	Default value: <undefined></undefined>
http.method.multi part.boundary	The multipart boundary string to use in conjunction with the MultipartRequestEntity. When this property is not set, a random value will be generated for each request.
	Type: String
	Syntax:
	Default value: <undefined></undefined>

Name	Description
http.method.response. buffer.warnlimit	The maximum buffered response size (in bytes) that triggers no warning. Buffered responses exceeding this size will trigger a warning in the log. If not set, the limit is 1 MB.
	Type: Integer
	Default value: 1
http.method.retry- handler	The method retry handler used for retrying failed methods. For details see the Exception handling guide.
	Type: HttpMethodRetryHandler
	Syntax: Fully qualified classname
	Default value: default implementation
http.protocol.allow- circular-redirects	Defines whether circular redirects (redirects to the same location) should be allowed. The HTTP spec is not sufficiently clear whether circular redirects are permitted, therefore optionally they can be enabled.
	Type: Boolean
	Default value: <undefined></undefined>
http.protocol.content -charset	The charset to be used for encoding content body.
	Type: String
	Default value: ISO-8859-1
http.protocol.cookie- policy	The cookie policy to be used for cookie management.
	Type: String
	Default value: CookiePolicy.RFC_2109
http.protocol.creden tial-charset	The charset to be used when encoding credentials. If not defined then the value of the http.protocol.element-charset should be used.
	Type: String
	Default value: <undefined></undefined>
http.protocol.element -charset	The charset to be used for encoding/decoding HTTP protocol elements (status line and headers).
	Type: String
	Default value: US-ASCII

Name	Description
http.protocol.expect- continue	Activates "Expect: 100-Continue" handshake for the entity enclosing methods. The "Expect: 100-Continue" handshake allows a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the "Expect: 100-continue" handshake can result in noticeable performance improvement for entity enclosing requests (such as POST and PUT) that require the target server's authentication. "Expect: 100-continue" handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support HTTP/1.1 protocol. Type: Boolean Default value: <understand< td=""></understand<>
http.protocol.head- body-timeout	Sets period of time in milliseconds to wait for a content body sent in response to HEAD response from a non-compliant server. If the parameter is not set or set to -1 non-compliant response body check is disabled. Type: Integer Default value: <undefined></undefined>
http.protocol.max- redirects	Defines the maximum number of redirects to be followed. The limit on number of redirects is intended to prevent infinite loops. Type: Integer Default value: <undefined></undefined>
http.protocol.reject- head-body	Defines whether the content body sent in response to HEAD request should be rejected. Type: Boolean Default value: <undefined></undefined>
http.protocol.reject- relative-redirect	Defines whether relative redirects should be rejected. Type: Boolean Default value: <undefined></undefined>

Name	Description
http.protocol.single- cookie-header	Defines whether cookies should be put on a single response header.
	Type: Boolean
	Default value: <undefined></undefined>
http.protocol.status- line-garbage-limit	Defines the maximum number of ignorable lines before we expect a HTTP response's status code.
	With HTTP/1.1 persistent connections, the problem arises that broken scripts could return a wrong Content-Length (there are more bytes sent than specified). Unfortunately, in some cases, this is not possible after the bad response, but only before the next one. So, HttpClient must be able to skip those surplus lines this way. Set this to 0 to disallow any garbage/empty lines before the status line. To specify no limit, use Integer.MAX_VALUE.
	Type: Integer
	Default value: <undefined></undefined>
http.protocol.strict- transfer-encoding	Defines whether responses with an invalid Transfer- Encoding header should be rejected.
	Type: Boolean
	Default value: <undefined></undefined>
http.protocol.unambig uous-statusline	Defines whether HTTP methods should reject ambiguous HTTP status line.
	Type: Boolean
	Default value: <undefined></undefined>
http.protocol.version	The HTTP protocol version used per default by the HTTP methods.
	Type: HttpVersion
	<pre>Syntax: <(int)major>.<(int)minor>; e.g., 1.1</pre>
	Default value: HttpVersion_1_1

Name	Description
http.protocol.warn- extra-input	Defines HttpClient's behavior when a response provides more bytes than expected (specified with Content-Length header, for example). Such surplus data makes the HTTP connection unreliable for keep-alive requests, as malicious response data (faked headers etc.) can lead to undesired results on the next request using that connection.
	If this parameter is set to true, any detection of extra input data will generate a warning in the log.
	Type: Boolean
	Default value: <undefined></undefined>
http.socket.linger	The linger time (SO_LINGER) in seconds. This option disables/enables immediate return from a close() of a TCP Socket. Enabling this option with a non-zero Integer timeout means that a close() will block pending the transmission and acknowledgement of all data written to the peer, at which point the socket is closed gracefully. Value 0 implies that the option is disabled. Value -1 implies that the JRE default is used.
	Type: Integer
	Default value: <undefined></undefined>
http.socket.receive buffer	The value to set on Socket.setReceiveBufferSize(int). This value is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket.
	Type: Integer
-	Default value: <undefined></undefined>
http.socket. sendbuffer	The value to set on Socket.setSendBufferSize(int). This value is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket.
	Type: Integer
	Default value: <undefined></undefined>

Name	Description
http.socket.timeout	Sets the socket timeout (SO_TIMEOUT) in milliseconds to be used when executing the method. A timeout value of zero is interpreted as an infinite timeout.
	Type: Integer
	Default value: <undefined></undefined>
http.socket.timeout	The default socket timeout (SO_TIMEOUT) in milliseconds which is the timeout for waiting for data. A timeout value of zero is interpreted as an infinite timeout. This value is used when no socket timeout is set in the HTTP method parameters.
	Type: Integer
	Default value: <undefined></undefined>
http.tcp.nodelay	Determines whether Nagle's algorithm is to be used. The Nagle's algorithm tries to conserve bandwidth by minimizing the number of segments that are sent. When applications need to decrease network latency and increase performance, they can disable Nagle's algorithm (by enabling TCP_NODELAY). Data will be sent earlier, at the cost of an increase in bandwidth consumption.
	Type: Boolean
	Default value: <undefined></undefined>
http.useragent	The content of the User-Agent header used by the HTTP methods.
	Type: String
	Default value: <official name="" release=""> e.g., Jakarta Commons-HttpClient/3.0</official>
